CLIMATOLOGICAL DATA

NATIONAL SUMMARY

JANUARY 1975

GENERAL SUMMARY OF WEATHER CONDITIONS

Dr. Richard E. Felch, Climatologist

HIGHLIGHTS: January temperatures averaged above normal across the Nation except for the western Mountain States, most of California and the northern tip of Maine. The northern Great Plains and areas east of the Mississippi averaged 4 to 6° above the normal, except over the Appalachians.

Precipitation amounts varied from none in parts of Arizona to about 20 inches on the Washington Coast. Amounts were above normal over most of the Country. Notable exceptions were the west central Great Plains, southern Florida, the Desert Southwest, all of California and northern Montana. Well above normal areas included Georgia, Alabama and Louisiana, most of the Corn Belt except for eastern Iowa, and the northern Great Plains.

PRECIPITATION: The New Year began with moderate rainfall over the eastern States and Deep South. Snow blanketed the Great Lakes area.

During the week ending on the 12th, heavy rains fell over the Deep South and a major blizzard moved across the northern Plains. Rainfall totaling 5 inches or more fell over parts of Louisiana, Mississippi, Alabama, and Georgia. Tornadoes ripped through the Southeast on the 10th. Forty-one were reported through the central Gulf Coast. The blizzard in the upper Midwest dropped heavy snows driven by 30 to 70 m.p.h. winds. Several deaths were attributed to the storm, and hundreds of travelers were left stranded.

Precipitation was generally lighter during the following week, although the remnants of the snow storm of the previous week whitened New England. Other weak storm systems also produced some light precipitation in the Northwest and Northeast. Over the weekend of the 18th, a winter storm moved out of the Rockies and spread precipitation over most of the eastern United States.

A powerful winter storm packed heavy snows around the Great Lakes during the week ending the 26th as upper Michigan was covered with over 40 inches of snow. As much as 2 feet of new snow fell in Minnesota. Heavy thundershower activity on the 24th and 25th dropped as much as 2 inches of rain over the Southeast.

The month ended with heavy rains along a stationary front across the Nation's midsection. Heavy rain fell along the front with totals ranging from 1 to 3 inches over sections of Texas, Oklahoma, Kansas, Missouri, and Arkansas.

TEMPERATURE: Temperatures averaged well above normal during the opening week of January over the eastern half of the Nation. Only the Southwestern quadrant averaged below normal.

The week ending the 12th was quite similar in temperature distributions. Most of the Northeast averaged 6 to 15° above normal. Record highs were set in many Midwestern cities on the 10th and 11th, despite the blizzard howling to the west.

The distribution of temperature departures reversed during the week of the 19th. The western States were well above normal, while the eastern States cooled markedly. Parts of Montana were as much as 18° above normal. In the South only southern Florida escaped freezing temperatures.

The entire Nation averaged above normal during the week ending the 26th, although cold air invaded the Nation briefly at midweek.

The month ended with the eastern States again well above normal and extremely cold temperatures in the western States.

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JANUARY 1975

Herbert J. Thompson and Raymond J. Haley,
Office of Hydrology

Major flooding occurred along the Snoqualmie River in Washington. A record crest stage was reported on the Umatilla River in northeastern Oregon although damage was comparatively light. Minor to moderate flooding was widespread along the Gulf and Atlantic slope drainages from Texas to Virginia and in the Illinois and Ohio River Basins. Some flooding was reported in the lower Missouri, White, Arkansas, and lower Mississippi Basins, along the Oregon coast, and in the Willamette Basin.

There were problems from ice jams in the upper Midwest, particularly on the Rock River in Illinois and on the Missouri River.

Urban flooding occurred in western New York and Kentucky.

Hydrologic events of unusual significance and/or involving loss of life or property are discussed in more detail below.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ST. LAWRENCE DRAINAGE		
Southern Michigan Streams	A combination of rainfall and snowmelt totaling 1.5 to 2.5 inches during the period of the 8th-11th caused strong rises on most streams in the area. Crests were generally in the range of one-half bankfull to near flood stage. The Clinton River went slightly over flood stage at Fraser with some urban flooding reported in the Detroit suburbs. Several ice jams formed along the Grand River with backwater reaching to within a foot of flood stage at Portland. This flood threat persisted for several days.	0	N.A.
Maumee River Basin	Rainfall averaging about 1.5 inches during the period of the 7th-12th combined with snowmelt to cause substantial rises on streams in the basin. Crests about 2 feet over flood stage occurred on the St. Joseph River at Montpelier, Ohio, and the Tiffin River at Stryker, Ohio, with flooding lasting about a week on these streams. Other streams in the basin crested below flood stage. A second strong rise occurred in the basin late in the month but no flooding resulted.	0	N.A.
Western New York Streams	Heavy local showers on the 29th caused urban and small stream flooding in Buffalo and vicinity. One youth drowned while playing on a rain-swollen stream.	1	N.A.
	ATLANTIC SLOPE DRAINAGE		
Susquehanna River Basin	Mild temperatures the second week of the month caused rapid snowmelt with some bottom-land flooding along the Chemung River in the headwaters of the basin. The Chemung crested about 2 feet over flood stage at Chemung, N.Y., on the 12th. Other headwater streams generally crested at one-half to three-quarters bankfull.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JANUARY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Continued		
Coastal Streams in North Carolina	Rainfall was frequent and heavy over North Carolina with many monthly totals in excess of 6 inches. The most significant rainfall occurred during the period of the 10th-13th with storm totals of about 2 to 4 inches. Moderate flooding was reported with crests up to 4 feet over flood stage on the Tar River, 7 feet over flood stage on the Neuse River, and 15 feet over flood stage on the Cape Fear River. Another period of rainfall on the 24th-26th with amounts of up to 2 inches caused minor flooding on the lower Tar and upper Neuse Rivers and a crest 8 feet over flood stage at Huske Lock and Dam on the Cape Fear River. Flooding on the lower Neuse and Cape Fear Rivers Continued into February. The lower Roanoke River ran about 1 foot over flood stage from the 17th through the end of the month due to releases from upstream reservoirs.	0	N.A.
Pee Dee, Santee, and Edisto River Basins	Monthly rainfall totals averaged 4 to 6 inches over the headwater areas, 7 to 8 inches over the middle portions of these basins and 4 to 5 inches over the lower reaches. During the period of the 11th-13th a deep trough aloft and a north-south oriented cold front moved across the Carolinas triggering heavy rainfall of 2 to 3 inches. A somewhat similar situation occurred on the 19th to 20th and again on the 24th to 25th with surface lows moving northeast along the coast. Flooding was widespread but generally minor. However, crests of 6 and 5 feet over flood stage occurred on the Rocky River at Norwood, N.C., on the 11th and 25th, and a crest more than 8 feet over flood stage was reported on the Broad River at Blair, S.C. The Lumber River remained over flood stage from the 12th through the end of the month with damages estimated at $3,000. Crests about 5 feet over flood stage occurred on the Pee Dee River at Cheraw, S.C., on the 14th and 27th with damages downstream of $10,000 mainly from disruption of logging activities. Losses to small grains on the Congaree River below Columbia, S.C., were estimated at $3,000. Urban flooding from locally heavy rainfall occurred at Lancaster, S.C., the night of the 24th, and flash flooding on small streams around Chester, S.C., was reported on the 13th.	0	16
Savannah, Altamaha, and Satilla River Basins	A series of storms during the period of the 8th-13th caused rainfall totals ranging up to more than 4 inches for the period over much of Georgia. Strong rises occurred on most streams but flooding was generally minor. The lower Savannah crested about 2 feet over flood stage at Clyo, Ga., and continued in flood thru the end of the month. More than 4 feet of flooding was reported on the Oconee River at Milledgeville, Ga. Minor flooding was reported on portions of the Ogeechee, Ocmulgee, Altamaha, and Satilla Rivers.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JANUARY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Continued		
Apalachicola River Basin	During the period of the 8th-13th, rainfall totaled over 4 inches over the headwaters of the basin and nearly 6 inches over the lower Apalachicola with the river cresting 5 feet over flood stage at Blountstown, Fla., on the 15th. Minor flooding occurred on Peachtree Creek in Atlanta, Ga.	0	N.A.
Alabama River Basin	Frequent rains occurred during the month with 1 to 2 inches in 24 hours common during the period of the 7th-12th which resulted in light flooding on the lower Alabama River beginning on the 11th, with damage estimated at $68,000 to agriculture and $8,000 to roads. Crests were about 3 feet over flood stage. Heavy rain the night of the 24th caused urban and small stream flooding along a 50-mile wide area from near Semopolis, Ala., to Rome, Ga. Amounts were generally 2 to 3 inches with locally heavier amounts of more than 4 inches, particularly over the urban centers of Birmingham and Gadsden, Ala. Damage from urban flooding was minor, however, light flooding developed on the upper Cahaba River with agricultural damage estimated at $5,000.	0	81
Tombigbee River Basin	Flooding continued into the first few days of January on the Upper Tombigbee River and its East Fork and Tibbee Creek tributaries, and began at Gainesville, Ala., on the 4th as a result of late December rains. January precipitation was well above normal, averaging 7 to 8 inches over the middle and upper portions of the basin. The heaviest rainfall occurred the second week of the month with amounts of 4 inches or more. A second period of rain on the 24th-26th left amounts of up to over 3 inches. Both storms caused some light flooding on headwater tributaries while more significant flooding occurred on the lower Tombigbee which lasted all month at Coffeeville, Ala., where a crest nearly 9 feet over flood stage occurred. Losses were estimated by the Corps of Engineers at $28,000 to agriculture on the lower Black Warrior River and $275,000 agriculture, $33,000 road, and $590,000 urban on the lower Tombigbee.	0	926
Pascagoula and Pearl River Basins	Monthly rainfall totals were generally in the range of 3 to 8 inches, but as much as 13 inches was reported in the south central part of the state. The heaviest period of rain occurred during the second week of the month with 5.2 inches reported at Meridian, Miss., for the period which caused significant flooding on the upper Chickasawhay River with crests 9 to 12 feet over flood stage. Elsewhere in the Pascagoula Basin moderate flooding occurred along Tallahala Creek and the lower Leaf River and minor flooding in the lower part of the basin. Flooding on the Pearl River continued from December, ending on the Upper Pearl and at Columbia, Miss., during the first week of the month, but	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JANUARY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Continued		
	returning to flood conditions during the third week following the period of heavy rainfall. The middle reach of the Pearl remained above flood stage most of the month, except at Columbia, while flooding on the lower Pearl in Louisiana lasted all month and extended into February. Crests were generally about 5 feet over flood stage for the January flooding.		
	UPPER MISSISSIPPI BASIN		
Rock River	There was some local overflow from ice jams on the Rock River between Moline and Joslin, Ill., caused by snowmelt runoff. Fluctuations in stage due to ice action continued during the latter half of the month on that reach of the stream. However, no reporting stations went over flood stage.	0	N.A.
Illinois and Meramec Rivers	On the 10th-11th heavy rainfall resulted from a surface frontal system associated with an upper level trough which closed aloft to produce an unusually deep cold-core system. Amounts of over 3 inches fell over the Illinois Basin in Illinois and the lower Meramec River in east-central Missouri. Sharp rises occurred on the Upper Illinois and lower Meramec Rivers. Crests were up to 4.5 feet over flood stage on the Upper Illinois and over 5 feet above flood stage on the lower Meramec Rivers. Minor flooding occurred on the Illinois River at Beardstown. Damage was probably light at this season of the year.	0	N.A.
	MISSOURI BASIN		
Missouri River Main Stem	Several ice jams formed on the Missouri River due to rapidly fluctuating temperatures during the middle of the month. A jam below Washburn, N.D., caused a rise of 6.5 feet but no flooding resulted. On the 12th-13th a jam eventually extending from 4 miles north of Sioux City, Iowa, to 10 miles south of Yankton, S.D., flooded about 1,000 acres above the mouth of the Vermillion River. Ice jams above Leavenworth, Kansas, created unusually low stages below Leavenworth. Kansas City had two periods of negative stages reaching a -1.00 foot on the 12th and a -0.72 foot on the 17th.	0	N.A.
Marais des Cygnes Basin	A stationary frontal system caused from 1 to 2.5 inches of rain over the lower portion of the basin on the 31st with the Marmaton River cresting slightly over flood stage at Ft. Scott, Kansas.	0	0
	OHIO BASIN		
Youghiogheny and Cheat River Basins	Moderate to heavy rain fell over these basins during the 24 hours ending on the 1st. Sharp	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JANUARY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	OHIO BASIN-Continued		
	rises occurred on streams in the basin but no reports of major flooding were received. The Youghiogheny River crested at flood stage in Connellsville, Pa., with resultant street flooding.		
Mahoning River	Moderate rain on the 9th combined with releases of 980 c.f.s. from Milton Reservoir produced a crest 2.2 feet over flood stage at Warren, Ohio. This flow with an additional 520 c.f.s. from Mosquito Reservoir caused a crest 1.3 feet over flood stage at Youngstown, Ohio. Some damage occurred at Youngstown.		
Scioto River	Precipitation during January ranged from 10 to 50 percent above normal over the basin. There were two periods of heavy rainfall from the 9th to the 13th and the last few days of the month, with 1 to 2 inches of rainfall on each occasion. Strong rises occurred on the Scioto River with crests just below flood stage, except at Circleville, Ohio, where about 2 feet of flooding was reported on both rises.	0	N.A.
Green River Basin	During the period of the 10th-11th rainfall averaged about 2 inches over the basin with locally heavier amounts up to 3 inches over the Barren River Basin. Reservoir storage prevented river flooding at Bowling Green, Ky., on the Barren River, however, urban and flash flooding was reported in Bowling Green and Franklin, Ky., where high water on Drake's Creek damaged the water supply intake structure. Light flooding occurred at Woodbury and Calhoun, Ky., on the lower Green River. Urban flooding was also reported at Nortonville, Hansen, Dawson Springs, Earlington, Madisonville, and Henderson.	0	N.A.
Wabash River Basin	Precipitation during January was well above normal over the basin, ranging up to 200 percent of normal over the lower portion. Measurable precipitation was recorded on an average of 15 days at most stations. Rivers were on the rise at the beginning of the month with some flooding on the Embarras and Little Wabash Rivers during the first week of the month. With stream levels continuing at a high level rainfall of 1.5 to 3 inches during the period of the 9th-11th was sufficient to cause moderate flooding over the lower portion of the basin. A crest nearly 8 feet over flood stage occurred on the Embarras River at Lawrenceville, Ill., 4 to 5 feet of flooding occurred on the lower White and the Little Wabash Rivers, and from 3 to 6 feet of flooding occurred on the middle Wabash with minor flooding downstream. Minor flooding occurred on portions of the Little Wabash and Wabash Rivers which extended into February.	0	N.A.
Cumberland River Basin	During the period of the 10th-12th from 3 to 3.5 inches of rain fell over the Harpeth and Red tributary basins with resultant flooding of 4 to 6	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JANUARY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	OHIO BASIN-Continued		
	feet over unplanted agricultural lands. Urban flooding was reported in Hopkinsville, Tenn., with 2.7 inches recorded for the storm.		
Tennessee River Basin	Rainfall over the Duck and Elk tributary basins averaged about 2.5 inches for the storm of the 10th-12th. The Duck River crested 1 foot over flood stage at Columbia, Tenn., while the Elk River crested just below flood stage at Fayetteville. During the same period rainfall over the South Chickamauga Creek Basin averaged about 2 inches with a crest slightly over flood stage. However, on the 25th rainfall of 2 inches in less than 24 hours caused a crest 2.5 feet over flood stage at the gage near Chattanooga, Tenn. Flooding on these streams was limited to low-lying, unplanted agricultural land.	0	N.A.
Ohio River Main Stem	There were several rises on the Ohio River during the month with heavy inflow from the Green and Wabash Basins causing the river to go over flood stage at Dam 50, Fords Ferry, Ky., and at Cairo, Ill., the middle of the month.	0	N.A.
	WHITE BASIN		
White, Black, and Cache Rivers	The Cache River at Patterson and the White River at Augusta, Ark., went over flood stage the 1st and 2d of the month, respectively, as a result of late December rainfall and, aided by near normal rainfall, continued in flood through the end of the month. Minor flooding occurred on the lower Black and White Rivers as a result of rains of around 2 inches during the period of the 8th-11th. Flooding continued into February on the lower White River.	0	N.A.
	ARKANSAS BASIN		
Verdigris and Neosho River Basins	Moderate to heavy rains of 1.5 to 2.5 inches on the 30th and 31st caused sharp rises on streams in the lower Arkansas, Verdigris, and Neosho Basins. Flooding occurred on Bird Creek and the Little Caney River in the Verdigris Basin and along the lower Neosho River. A crest nearly 6 feet over flood stage occurred on Bird Creek at Sperry, Okla., and about 4 feet of flooding occurred on the lower Neosho.	0	N.A.
	RED BASIN		
Ouachita River	Heavy rains of around 2 inches during the period of the 8th-11th caused flooding of agricultural land around Camden, Ark., with a crest there of 1.7 feet over flood stage. Damage was light at this season.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JANUARY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	LOWER MISSISSIPPI BASIN		
St. Francis River	Runoff from heavy rains over southeast Missouri on the 10th combined with releases from Wappapello Reservoir to cause minor flooding of low-lying, unplanted agricultural land around St. Francis, Ark., for ten days.	0	N.A.
Big Black River (Mississippi)	Flooding continued from December along the Big Black River which had crested 7 feet over flood stage at West on Dec. 31. Downstream, the crest at Bovina occurred on the 1st about 2 feet over flood stage. Rainfall totals for the month ranged from about 3 to 8 inches over the basin with the heavier amounts over the lower portion. Much of this rain fell during the period of the 8th-11th causing a second crest about 3 feet over flood stage along the lower reaches of the stream. Agricultural and logging operations were at a standstill during the month in the inundated areas with livestock and machinery evacuated.		
Amite River	Monthly rainfall totals ranged from 7 to 10 inches with most of the rain falling during the period of the 7th-11th. Minor flooding occurred at Denham Springs with a crest 1 foot over flood stage. According to the U.S. Geological Survey flow of the river near Denham Springs was 250 percent of the long-term January average.	0	N.A.
	WEST GULF OF MEXICO DRAINAGE		
Mermentau, Calcasieu River Basins (Louisiana)	The Calcasieu River was above flood stage to below Kinder, at the beginning of the month ending at Oakdale and Kinder the 1st and 3d, respectively, but continuing at Hineston until the 19th due to heavy rains of 3 to 4 inches on the 8th-11th. This storm caused a second crest at Hineston nearly 4 feet over flood stage, causing minor flooding at Kinder and on the West Fork Calcasieu, and moderate flooding on the Mermentau River with a crest 1.6 feet over flood stage at Mermentau.	0	N.A.
Sabine, Necheo, and Trinity River Basins	Lowland flooding continued in several portions of these basins from December ending at Crandall on the East Fork Trinity River on the 7th. This flooding lasted the entire month on the Sabine River at Deweyville, the Angelina River at Lufkin, and the Neches River at Diboll, and until the 29th at Moss Bluff on the Trinity. Rainfall of 3.5 to 8 inches during the month helped to maintain flooding at these points. Heavy rainfall of up to 5 inches on the 8th caused some flooding on Attoyac Bayou, the Neches River at Beaumont, and the East Fork of the Trinity.		
	PACIFIC SLOPE DRAINAGE		
Coastal Basins in Oregon	Heavy rains of up to 7.5 inches during the period of the 3d-6th caused strong rises on several coastal streams in Oregon with the South Fork Coquille River	0	48

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	PACIFIC SLOPE DRAINAGE-Continued		
	cresting about 3 feet over flood stage at Myrtle Point. Flooding was limited to pasture lands and some secondary roads. Minor flooding occurred on the Wilson River at Tillamook while the Nehalem and Siletz Rivers crested just below flood stage. A second storm on the 13th-16th over the northern Coastal Range melted the snow cover of up to 12 inches. Rain over the Wilson River Basin ranged up to at least 9 inches for this storm with the river cresting about 2 feet over flood stage at Tillamook. In the Nehalem Basin a point rainfall total of 12.6 inches was observed for this storm and the river crested 4 feet over flood stage at Foss. Flooding along both streams was limited to agricultural land.		
Walla Walla and Umatilla Rivers	Record flooding occurred on the Umatilla River at Pendleton, Ore., as a storm moved up the Columbia River on the 23d-26th. Storm rainfall totals ranged from 5 inches over the lower Columbia to more than 2 inches over the Umatilla Basin which combined with unseasonably warm temperatures (freezing levels 9-10,000 feet) to cause considerable melting of an above normal snow pack in the Blue Mountains which resulted in the record producing runoff. The discharge associated with the crest of 11.5 feet (3.5 feet above flood stage) was computed to be 17,200 c.f.s. The previous maximum of record was 15,500 c.f.s. on Jan. 30, 1965. Flows of 17,000 c.f.s. and 15,500 c.f.s. occurred in 1882 and 1906, respectively, from studies made by the Corps of Engineers. Although the city of Pendleton is protected by a levee, several bridges and the levee were damaged and 20 families were evacuated from South Pendleton and Mission. The Walla Walla River crested short of major flood stage at Touchet, Wash., with minor damage estimated at $500.	0	230.5
Willamette River Basin	The three storms which deposited heavy rainfall over portions of the northern Coastal Range during the month as discussed above also caused sharp rises on tributaries of the Willamette River draining the east slopes of the Coastal Range. Several of these streams went over flood stage including the South Hamhill, Pudding, and Tualatin Rivers. Flooding was generally in the range of 1 to 2 feet although a crest nearly 5 feet over flood stage occurred on the upper South Yamhill River on the 5th. A crest 2.7 feet over flood stage occurred on Johnson Creek near Portland on the 25th.	0	90
Chehalis River Basin	Freezing levels ranged from 6,000 to 8,000 feet over the basin on the 12th-15th and rainfall amounts ranged up to 5.5 inches for a 30 hour period on the 12th-13th. The combination of rainfall and snowmelt caused flooding along the Chehalis River with a crest 2.8 feet over flood stage at Centralia,	0	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	PACIFIC SLOPE DRAINAGE-Continued		
	Wash.		
Snohomish River Basin	Major flooding occurred on the 17th-19th along the Snoqualmie River, a major tributary of the Snohomish. A crest nearly 5 feet over flood stage was reported at Carnation, Wash., which was the highest stage there since 1959. Heavy warm rain began late on the 16th and the freezing level rose from 4,500 feet at 4 p.m. on the 16th to 9,000 feet at 4 a.m. on the 17th, resulting in substantial snowmelt. Damage estimates by the Corps of Engineers indicate losses of $3.4 million along the Snoqualmie and $200,000 along both the Skykomish and Snohomish Rivers.	0	3,800

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code [illegible] defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units Milli atmo-cms.

REFERENCE NOTES

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES: Dates in the table apply to the period 24 hours prior to time of observation. In some cases the actual occurrence is on the calendar date preceding that shown. (See individual Climatological Data for times of observations)

+	And also on an earlier date or dates.
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch of water equivalent to every 10 inches of snowfall.

CLIMATOLOGICAL DATA - METRIC UNITS: Data from airport unless otherwise specified.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile data can be evaluated.

B	Number of days maximum 21.1°C. or above for Alaskan Stations.
Y	Peak Gust.
+	And also on an earlier date or dates.
U	Indicates Urban site.
R	Indicates Rural site.
Ø	Station pressures apply to elevations shown in the "Elevations" table of the annual issue of this publication.

Conversion formulae to English Units are as follows:

1 foot = 0.3048 meters
$^{\circ}F. = \frac{9}{5} \times {}^{\circ}C + 32$
1 inch = 25.4 millimeters
1 mile per hour = 0.447 meters per second

HEATING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

COOLING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

STORM SUMMARY:

°	Includes crop damage.
C	Crop damage.
*	No occurrence of storms or unusual weather phenomena reported.
@	Includes heavy sleet storm.
#	Freezing drizzle and freezing rain, commonly known as glaze.
Ø	For breakdown of "All Others," and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
‡	No Storm Data Report received for this State.
<>	Report Incomplete.
†	Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5 Million
7	$5 Million to $50 Million
8	$50 Million to $500 Million
9	$500 Million to $5 Billion.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS:

1	Flooding continued at the end of the month.
NA	Not available.

FLOOD STAGE DATA:

#	Highest Stage Observed
1/	Continued at end of month
___	Highest Stage of Record
E	Estimated
P	Provisional (Flood Stage)
U	Unknown

RAWINSONDE DATA (Average Monthly Values):

All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon. The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors. These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

*	Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.
+	Observations for these stations are scheduled at 0000 G.C.T.
†	Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

REFERENCE NOTES - Continued

SOLAR RADIATION INTENSITIES: Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

()	Clouds Present	DM	Moderate Dust	HM	Moderate Haze	KS	Slight Smoke
*	Values corresponding to true solar noon	DS	Slight Dust	HS	Slight Haze	M	Moderate Haze-indeterminable
BD	Blowing Dust	F	Fog	I	Intense Haze-indeterminable		
BN	Blowing Sand	GF	Ground Fog	K	Smoke	N	Sand
D	Dust	H	Haze	KI	Intense Smoke	S	Slight Haze-indeterminable
DI	Intense Dust	HI	Intense Haze	KM	Moderate Smoke		

NET RADIATION: The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA: These data are from an U-V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA: The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded $\Omega\ \Omega\ \Omega$) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λ_s designates the type of measurement made.

DESCRIPTION OF CHARTS

CHART I. A. NORMAL DAILY AVERAGE TEMPERATURE (°F. 1941-70) FOR MONTH. B. TEMPERATURE DEPARTURE FROM 30-YEAR MEAN (°F 1941-70) FOR MONTH. Chart I-A is reproduced from monthly normals maps prepared at the National Climatic Center. Chart I-B is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin," a publication of Environmental Data Service.

CHART II. A. TOTAL PRECIPITATION. Chart II. A. is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin."

CHART II. B. PERCENTAGE OF NORMAL PRECIPITATION. Chart II. B. is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin."

CHART III. TRACKS OF CENTERS OF ANTICYCLONES AT SEA LEVEL.

CHART IV. TRACKS OF CENTERS OF CYCLONES AT SEA LEVEL. Centers which can be identified for 24 hours or more are tracked in these charts. Semi-permanent features such as the Great Basin and Pacific Highs and Colorado and Mexico Lows are not shown. The 7:00 a.m., e.s.t., positions are shown by open circles, with the intermediate positions at 6-hour intervals shown by solid dots. The date is given above the circle and the central pressure to whole millibars below. A dashed track indicates a regeneration rather than actual movement to the next position. Solid squares indicate position of stationary center for period shown beside it.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

FEBRUARY 1975

GENERAL SUMMARY OF WEATHER CONDITIONS

Dr. Richard E. Felch, Climatologist

HLIGHTS: Precipitation was well above normal east
a line from Duluth, Minn., to El Paso, Texas, ex-
t for Florida and the Gulf Coast. Brownsville,
as, received only 0.09 inches, 7% of normal. The
ific Northwest was also well above normal. East-
Montana, western North Dakota, all of South
ota and Nebraska, western Kansas, eastern Colo-
o and most of Utah were well below normal.

Mississippi River divided the Nation in the dis-
bution of average temperatures for the month with
ve normal temperatures to the east. Most of
sas, Nebraska, Wyoming, and Montana averaged at
st 6° below normal, due primarily to extremely
d temperatures early in the month. Most of
rida averaged nearly 6° above normal.

CIPITATION: Three storm systems moved across the
ion during the first week of February, producing
e precipitation in most areas. Heaviest amounts
l in the Southeast and along the Pacific Coast.

same distribution of rainfall occurred the week
the 10th-16th with very heavy rains in Louisiana,
sissippi, Alabama, and Georgia. Amounts of 3 to
nches were common in this area. Violent weather
associated with the heavy rains. Tornadoes were
orted at Innis, La., Rolling Fork, Miss., and Bay
nette, Ala.

torm packing heavy precipitation, tornadoes, and
h winds cut a path from eastern Oklahoma through
Ohio Valley the week ending the 23d, dumping
cipitation in excess of 3 inches across a wide-
ead area including Illinois, Indiana, Kentucky,
Ohio. In the Southeast, other storms dropped 2
5 inches of rain on water-soaked soils. Heavy
w fell from eastern Oklahoma to northern Illinois.

the final week of February, precipitation was
rse with significant amounts limited to the Wash-
ton-Oregon coast and the New England area. As
storm mentioned above moved northeastward it was
accompanied by high winds. Gusts of over 60 m.p.h. were reported at Chicago.

TEMPERATURE: In the coldest spell of the winter, bitter cold temperatures moved into the northern Rockies during late January and continued until mid-February. Temperatures moderated considerably at month's end, but the average for the month was below normal in most of the western two-thirds of the Nation.

During the week ending on the 9th, temperatures averaged at least 24° below normal over most of Montana and well below normal all the way into south Texas. Helena, Mont., averaged only -6°, which is 29° below normal. Most of the remainder of the Nation was also below normal.

The cold weather in Montana and the central and northern Great Plains continued for a third week. However most Southern States warmed to above normal readings.

Most of the eastern United States experienced near or above normal temperatures during the week ending on the 23d. The greatest above normal readings occurred in the eastern Corn Belt, and New England where temperatures averaged at least 12° above normal. The coldest departures occurred in the southern Great Plains where parts of Texas, Oklahoma, and New Mexico averaged 12° below normal.

Except for an area from Minnesota to the Gulf Coast, the Nation ended the month with well above normal temperatures in most areas. Most of the western Great Plains averaged 3 to 6° above normal.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

FEBRUARY 1975

Herbert J. Thompson and Raymond J. Haley
Office of Hydrology

There were several serious flood events during February. During the period of the 22d to 24th, a massive storm system moved from the south central plains up the Ohio River Valley into New England. Widespread flooding of varying degrees of severity occurred from Oklahoma to western New York and central Pennsylvania.

A major flash flood occurred at Nacogdoches, Texas, the night of Jan. 31-Feb. 1 with four lives lost and more than five million dollars in property damage.

Major flooding occurred in the East Gulf of Mexico drainage - the worst since 1929 in the Choctawhatchee River Basin. Record discharges were reported on small streams in the Choctawhatchee and Alabama River Basins where damage was estimated at more than $36 million.

These and other hydrologic events of unusual significance or involving loss of life or property damage are discussed in more detail below.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ST. LAWRENCE DRAINAGE		
Southern Michigan Streams	During the period of the 20th-24th rainfall amounts of up to 2 inches were reported which with warm temperatures and consequent snowmelt produced rises on streams in the area. The only significant flooding was on the Clinton River around Fraser where a crest nearly 2 feet over flood stage caused some road closures. The Raisin River went slightly over flood stage at Monroe. Crests along the Grand River were about two-thirds bankfull with stages just under bankfull on some tributaries.	0	N.A.
Maumee River Basin	Streams in the basin fell to near normal stages by the 17th when moderate rain combined with warmer temperatures caused snowmelt which reversed the trend. Heavy rains of 1 to 2 inches on the 22d to 24th caused sharp rises with the St. Mary's River, cresting 5 feet over flood stage at Decatur, Ind. Crests on the St. Josephs, Tiffin, and upper Maumee Rivers were generally 2 to 3 feet over flood stage. Flooding continued into March on these streams.	0	N.A.
Sandusky River	Average precipitation over the basin for the month was 3.56 inches - 180 percent of normal. More than 2 inches of this total occurred during the 22d-24th and caused light flooding along the Sandusky River with crests up to about 1 foot over flood stage.	0	N.A.
Niagara River Basin	Rains of 1.5 to 2 inches during the 23d-26th caused minor flooding along Ellicott and Tonawanda Creeks. On the 26th and 27th high winds caused water level in Lake Erie to rise about 5 feet, which combined with an ice jam at Niagara Falls to cause flooding in the Cayuga Island area of the city of Niagara Falls - a rather rare event. Some street and residential damage occurred.		N.A.
Genessee River Basin	Unseasonably warm temperatures caused considerable snowmelt from the 21st and was followed by rains of up to an inch which resulted in minor flooding along Oatka and Black Creeks. No flooding occurred on the main stem of the Genesee River.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

FEBRUARY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ST. LAWRENCE DRAINAGE-Cont'd		
Lake Champlain Drainage	Small stream flooding was reported in northwestern Vermont on the 24th due to a combination of snowmelt, rains of up to 1.5 inches, and ice jams. No reporting stations went over flood stage, however.	0	N.A.
	ATLANTIC SLOPE DRAINAGE		
Hudson River Basin	A warm, sunny period was followed by moderate to heavy rainfall which ranged up to 2.6 inches over the lower portion of the basin during the 48 hours ending at 7 a.m. on the 25th. The combination of snowmelt and rain produced strong rises on streams from the Mohawk Valley southward. The Wallkill River crested 1 foot over flood stage at Gardiner, N. Y., while Wappinger Creek went slightly over flood stage. The Mohawk River remained within banks in spite of a surge from the breakup of an ice jam which crested just below flood stage at Cohoes, N. Y.	0	N.A.
Raritan River Basin	Rainfall averaging about 1.5 inches over the basin the night of the 24th-25th combined with snowmelt to cause strong rises on streams in the basin with the Millstone River cresting 1 foot over flood stage at Blackwell's Mills, N. J., and the Raritan River going slightly over flood stage.	0	N.A.
Susquehanna River Basin	This was the third consecutive wetter-than-normal month in the Susquehanna Basin, with precipitation amounts averaging 3.41 inches, or nearly 150% of normal. Snow covered the ground to depths of three to six inches through the first nineteen days, with the snowcover re-established on the 25th in northern areas and remaining through the end of the month. Streamflow on the Susquehanna River and tributaries decreased until the 24th and 25th, when a major storm system brought 2 to 3 inches of precipitation (rain south and mixture of rain and snow north) to the basin. The runoff produced by the rain and melting snow resulted in significant rises on all streams. Some urban and small stream flooding was reported along with low-level flooding along most of the Susquehanna River. Flood stages were topped by 1 to 4 feet at several places and, with the exception of "AGNES" in 1972, reached the highest levels since March 1964. Moderate flooding also occurred along several tributaries, including the Tioga, Tunkhannock, and Chemung Rivers with the Chemung cresting 5 feet over flood stage at Chemung, N. Y. Minor flooding occurred along the Chenango River with crests less than 1 foot over flood stage.	0	N.A.
Coastal Basins in North Carolina	The lower Neuse and Cape Fear Rivers continued over flood stage from January. Rainfall of 1 to 2 inches the first four days of February caused the upper Neuse and middle and lower Cape Fear Rivers to go over flood stage and caused a second crest on the lower Neuse. Rainfall of 1 to over 2 inches on the 17th and up to 1 inch on the 22d caused additional flooding on these streams which continued into March on the lower Neuse River. This flooding was generally confined to	0	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	low-lying areas with crests of about 1 to 4 feet over flood stage and no substantial damage indicated. The Roanoke River was held at a relatively constant stage about 1 foot over flood stage at Williamston the entire month by releases from upstream reservoirs.		
Pee Dee, Santee, and Edisto River Basins	Monthly rainfall for the Yadkin River Basin in North Carolina, a tributary of the Pee Dee, was lower than in most other areas, averaging only 3½ inches. For the Pee Dee Basin in South Carolina, the average was 6 inches in northern sections and 5 to 5½ inches over the lower reaches. For the Lumber River Basin, the average was 4 inches, but one half of this amount fell in a 24-hour period ending on the 19th. For the Catawba Basin monthly totals averaged 4½ inches and were distributed well throughout the month. The Broad River Basin received an average rainfall for the month of 5½ inches. Tryon, N. C., received one of the higher totals with 6.39 inches. In the Saluda Basin mountain and foothill headwaters received 7 inches while lower areas received an average of near six inches. For the lower Santee Basin, Congaree, and Edisto Basins, monthly totals averaged 5¼ to 5½ inches. There was no flooding in the Yadkin or Catawba Basins while minor flooding occurred along the Broad River and the Saluda River below Lake Greenwood. On the Congaree River, work on the new bridge at Columbia, S. C., was halted repeatedly during the month but no losses occurred due to adequate warnings. However, lowland flooding below Columbia did an estimated $5,000 damage. There are no reporting stations along that reach. The Lumber River was above flood stage the entire month at Lumberton, N. C. The crest nearly 4 feet over flood stage was just below the stage at which serious damage occurs although a few families were evacuated. Losses were estimated at $10,000. The Pee Dee River was above flood stage for all but three days of the month with interruption of logging operations and losses estimated at $5,000. Lowland flooding along the lower Santee River caused losses of $5,000 to machinery which the owner failed to move after receiving adequate warnings.	0	25
Savannah, Ogeechee, and Alatamaha River Basins	Flooding continued from January on the lower Ogeechee and Savannah Rivers lasting the entire month on the latter stream. Two periods of heavy rainfall the week of the 16th-23d caused widespread but relatively light flooding on streams in these basins. Rainfall amounts totaled up to more than 5 inches for the period. Crests were generally 1 to 3 feet over flood stage with Clyo Ga., on the Savannah River reporting 4.2 feet over flood stage on the 28th.	0	N.A.
	EAST GULF OF MEXICO DRAINAGE		
Apalachicola River Basin	Heavy rainfall over the headwaters of the basin on the 3d-6th totaling nearly 4 inches resulted in a crest 1.8 feet over flood stage at Blountstown, Fla., on the 8th. Two periods of heavy rainfall during the	0	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	EAST GULF OF MEXICO DRAINAGE-Cont'd		
	week of the 16th-23d with storm totals ranging from 2 inches to more than 10 inches over a small portion of the basin in east central Alabama caused minor to moderate flooding along the Flint River with a crest 6.6 feet over flood stage at Albany, Ga. Severe flooding and substantial residential damage occurred along Kinchafoonee Creek, a tributary of the Flint. The Chattahoochee River crested 6.5 feet over flood stage at W. F. George Lock & Dam on the 19th. Downstream, the crest nearly 8 feet over flood stage on the Apalachicola River at Blountstown caused relatively light damage due to lack of development on the flood plain.		
Choctawhatchee River Basin	The heaviest rains in many years occurred on the 15th-18th over the headwaters of the Choctawhatchee River. The greatest amounts were concentrated over the upper Pea River, a tributary, with storm totals of between 10 and 11 inches. The crest stage of 37.26 feet at Elba, Ala., was the highest since 1929 when the record stage of 43.4 feet occurred. Flood stage at Elba is 30 feet. At Ariton upstream from Elba the crest stage of 24.38 feet was approximately as high as the 1929 flood. Discharges on some small streams in the headwaters of the basin approached or exceeded the highest of record from measurements by the U. S. Geological Survey. On the main stem of the Choctawhatchee River light flooding occurred at Newton and Caryville, Ala., with crests less than 2 feet over flood stage. Widespread flooding of farm and pasture land occurred with livestock and erosion losses heavy. Damage was reported at the communities of Ariton, Elba, and Sampson, Ala. Six homes were flooded near Ariton and 71 were flooded outside the levees at Elba. Estimates of damage in the basin by the Federal Disaster Assistance Administration included: roads and bridges $624,800; sewers, $67,100; parks, $10,800; farmland, buildings and livestock, $168,000; and urban (mostly in Elba), $380,300. Excellent warnings at Elba permitted evacuation of 700 people and moveable property with savings of $300,000 estimated by local officials.	0	1,251
Escambia River Basin	The storm of the 15th-18th discussed above deposited amounts over the basin ranging from about 3 to as much as 10 inches over a portion of the upper Conecuh River, which crested 6 feet over flood stage at River Falls, Ala., and 3 feet over flood stage downstream Brewton, Ala. Widespread flooding of low-lying roads and crop and pasture lands was reported. The crest discharge at Brantley, Ala., on the upper Conecuh was reported to have a frequency of 25 years by the U. S. Geological Survey. Damage of $419,000 to roads and bridges was estimated by the Federal Disaster Assistance Administration. The flood damage curves of the Corps of Engineers indicated agricultural losses of $356,000. A young boy drowned when he fell off a makeshift raft on a flooding creek near Luverne, Ala.	1	775
Alabama River Basin	Two major storms resulted in well above-normal rainfall over the basin with monthly totals of up to more than	1	34,816

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	EAST GULF OF MEXICO DRAINAGE-Cont'd		
	10 inches reported-3 to 4 inches above normal. The storm of the 15th-18th deposited amounts of 6 to 8 inches over the upper Alabama and lower Tallapoosa drainages with lesser amounts to the north. A crest 2 feet over flood stage was reported at Tallapoosa on the lower Tallapoosa River and crests of 10 to nearly 12 feet over flood stage occurred on the lower Alabama River with somewhat less flooding upstream. Small stream flooding was widespread with record or near record stages and discharges reported on some of them by the U. S. Geological Survey. The peak discharge of 90,000 c.f.s. for Cedar Creek near Minter was estimated to be 2.3 times that of the 100 year flood with a record stage of 26.5 feet. A near record stage of 28.4 feet on Catoma Creek which runs through the southern edge of Montgomery forced the evacuation of 200 people there with 65 homes flooded. A record discharge and near record stage occurred on Big Swamp Creek near Lowndesboro. Extensive damage to roads, bridges, crops, and livestock resulted from this small stream flooding, estimated at $80,000 in Wilcox County with one man drowned and 30 bridges washed out, $26,000 in Dallas County, and $74,500 in Lowndes County. Rains of 2 to 6 inches on the 3d-5th caused flooding on the upper Cahaba River which crested about 2 feet over flood stage at Centreville. This storm may also have contributed to the failure of Walter Bouldin Dam on the Coosa River. About 400 feet of the earthen portion of the dam gave way early on the morning of the 10th. There was no significant flooding downstream and no reporting stations went over flood stage. There was no loss of life. However, damage to the power plant was extensive, estimated at $17 million, and loss of power generation capacity for 1 to 2 years is expected to exceed that figure. Estimates of damage over the basin provided by the Federal Disaster Assistance Administration and the Crops of Engineers are: Cahaba River, $5,500 to agriculture and $26,000 to roads; Tallapoosa River, $10,000 to agriculture, $59,000 to roads and bridges and $100,000 urban; and Alabama River, $462,600 to agriculture, $123,000 to roads and bridges, and $30,000 urban.		
Tombigbee River Basin	Monthly rainfall over the basin was generally above normal, ranging up to over 9 inches in the headwaters, 5 to 7 inches over the middle portion of the basin and over 10 inches over the lower basin. Most of this rainfall occurred during two periods, the 3d-5th and the 15th-18th. The first storm deposited amounts of 4 to 5 inches over the basin with flooding generally of a minor nature. Crests of 2 feet over flood stage occurred on the lower Black Warrior River and 3.6 feet over flood stage at Coffeeville, Ala., on the lower Tombigbee. The second storm left amounts of 3 to 5 inches over the basin with heaviest amounts over the lower Tombigbee and the Black Warrior drainage. Flooding was a little more severe with a crest 2 feet over flood stage on Noxubee Creek at Macon, Miss., nearly 4 feet over flood stage on the lower Black Warrior, and from 4.6 to 7 feet over flood stage on	0	317

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

FEBRUARY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	EAST GULF OF MEXICO DRAINAGE-Cont'd		
	the lower Tombigbee. Flooding was generally confined to lowlands and damage was about 90 percent agricultural. Losses estimated by the Corps of Engineers include $74,000 on the East Fort Tombigbee, $80,000 along the Black Warrior River, and $163,000 on the Tombigbee River main stem.		
Pascagoula and Pearl River Basins	Monthly rainfall ranged from about 1 inch over portions of the lower Pearl River to nearly 8 inches over the headwaters of the Pearl and Pasacagoula Rivers. Except for locally heavy amounts above Jackson on the 1st-2d nearly all of this rain occurred during the storm of the 15th-18th and resulted in minor to moderate flooding on most streams in these basins. Flooding continued on the lower Pearl from January lasting until Feb. 5 at Pearl River but continuing the entire month at Bogalusa. Upstream, minor flooding occurred at Jackson, Miss., from the 2d to the 12th. Otherwise, flooding was caused by the storm of the 15th to 18th which produced crests on the Pearl River generally in the range of 3 to 5 feet over flood stage except at Jackson where a crest nearly 13 feet over flood stage occurred. Moderate flooding occurred on several tributaries of the Pasacagoula River, including the Leaf and Chickasawhay Rivers and Tallahala Creek with crests of about 2 to 4 feet over flood stage. Except for the evacuation of a few families at Jackson, the extensive lowland flooding mainly affected logging and agricultural operations which were at a standstill during the month.	0	N.A.
	UPPER MISSISSIPPI BASIN		
Illinois River Basin	Precipitation from the storm of the 22d-24th ranged from 1.5 inches over the upper portion of the basin to near 3 inches over the lower basin, some of which fell as snow. Most of the snow melted within a few days, but probably made only a minor contribution to flooding. From 1 to 2 feet of flooding occurred on the upper Illinois while on the lower Illinois below Havana flooding continued into March with no crests during February.	0	N.A.
Meramec River Basin	Heavy rainfall of about 2 inches Jan. 31 to Feb. 2 caused light flooding on the Bourbeuse River on the 2d and 3d. Rainfall of about 2.5 inches on the 22d-24th caused light flooding on the Bourbeuse and upper Meramec Rivers. Moderate flooding occurred along the middle and lower Meramec and lower Big Rivers with crests generally about 5 feet over flood stage.	0	N.A.
	MISSOURI BASIN		
Lower Missouri Basin	Heavy rainfall of 2 to 3 inches over the southern portion of the basin Jan. 30 to Feb. 1 caused sharp rises on most streams with minor flooding on the Blackwater River at Blue Lick, Mo. from the 2d to the 4th. Precipitation in the form of both rain and snow occurred on the 22d-24th with amounts of 2 to 3 inches. Rises again occurred on streams in the area with the Grand	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

FEBRUARY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	MISSOURI BASIN-Cont'd		
	River going slightly over flood stage at Sumner, Mo. Damage was negligible at this season of the year.		
	OHIO BASIN		
Allegheny River Basin	The storm of the 22d-24th deposited rainfall amounts of up to about 3 inches over the basin. This rain combined with warm temperatures to melt a snowpack ranging up to 10 inches in depth. The resultant runoff caused widespread urban and flash flooding with numerous streets and basements flooded. Crests of about 2 feet over flood stage occurred along the Clarion River in Pennsylvania and on the Allegheny River at Olean, N. Y. Minor flooding was reported at Russell, Pa., on Conewango Creek and on the Allegheny River at Salamanca, N. Y., and Freeport, Pa.	0	N.A.
Upper Ohio River Basin	Above normal rainfall for the month was climaxed by the storm of the 22d-24th which caused rainfall of from 2 to more than 3 inches over the basin. However, there was no significant accumulation of snow over this area prior to the storm. Urban and small stream flooding was widespread with numerous roads closed and basements flooded. The most significant flooding occurred in the upper Hocking River Basin where a crest 3.4 feet over flood stage was reported at Enterprise, Ohio. Twenty-five families were evacuated in Rockridge and two families in Chauncy, Ohio. The Corps of Engineers estimated damage in the Hocking River Basin at $712,600. Minor flooding occurred along the lower Hocking River, the Mahoning River, and on the Muskingam River at McConnelsville, Ohio. A crest 2 feet over flood stage occurred at Racine, W. Va., on the Ohio River, the only point on the upper Ohio to go over flood stage.	0	713
Middle Ohio River Basin	Precipitation was generally above normal over the area during the month, being 200 percent of normal over the Scioto River Basin. Rainfall amounts from the storm of the 22d-24th were generally in the range of 2.5 to 3.5 inches. There was no significant snow accumulation to contribute to the runoff. Significant flooding occurred along most of the Scioto River with crests ranging from 2 feet over flood stage in the headwaters to 9 feet over flood stage at Piketon, Ohio, in the lower reach of the river. Relatively minor flooding was reported along portions of Little Miami, East Fork Little Miami, and the lower Miami Rivers with crests in the range of 2.5 to 4.5 feet. There is no gage presently available on the lower Miami River at Miamitown. Several homes and businesses were evacuated in Hamilton County. Extensive flooding of low-lying farmland occurred but damage was light at this season. On the Licking River several thousand acres of bottomland were flooded with a crest estimated at 2 feet over flood stage at Falmouth, Ky. All points along the middle reach of the Ohio River crested below flood stage.	0	2,100
Salt and Green River Basins	Heavy rainfall spread over western and central Kentucky on the 22d-23d with amounts of up to 5 inches	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

FEBRUARY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	OHIO BASIN-Cont'd		
	reported. Extensive flooding of bottomland occurred with 20,000 acres inundated in the Salt Basin and 35,000 acres in the Green Basin. In the Salt Basin a crest 8 feet over flood stage occurred on Brashears Creek at Taylorsville and 3 feet of flooding on the Rolling Fork at Boston. On the lower Green River crests up to 5.5 feet over flood stage were reported.		
Wabash River Basin	Flooding from late January rains continued into early February along the lower Embarras and White, the upper Little Wabash, and portions of the middle and lower Wabash Rivers. Streams were therefore above normal and soils wet prior to the storm of the 22d-23d which deposited heavy rain over the basin. Storm totals averaged from 1.5 inches over the northern third of the basin to 3.5 inches over the southern third. Sharp rises occurred on streams in the basin with flood stage exceeded at most points. Flooding was relatively light on the more northern headwater streams, but moderate to severe flooding occurred along downstream reaches. Crests of as much as 8.5 feet over flood stage were reported on the lower Embarras, 6.7 feet over flood stage on the lower East Fork of the White River, more than 9 feet over flood stage on the lower White River, nearly 12 feet over flood stage on the lower Little Wabash and up to 8 feet over flood stage at some points on the middle and lower Wabash. Flooding continued into March with crests on the lower reaches of the larger streams occurring early in March. Two children were drowned at a small stream crossing near Columbus, Indiana.	2	N.A.
Cumberland and Tennessee River Basins	The storm of the 22d-23d caused flooding on several tributaries of the Cumberland and Tennessee Rivers although the main streams did not go over flood stage. In the Tennessee Basin, rains of 2 to 3.5 inches during the night of the 23d over the headwaters of the French Broad River caused minor flooding at Rosman, N. C. Rains of 2 to 3 inches over the upper Cumberland River caused flooding on the Harpeth River with a crest 6.8 feet over flood stage at Kingston Springs, Tenn., and minor flooding on the Red River at Port Royal, Tenn. The effect of the storm of the 22d-23d was increased by rains of 1.5 to 2 inches on the 16th-18th over the lower Tennessee Basin which caused some minor flooding along South Chickamauga Creek near Chattanooga. Low-lying agricultural land was inundated along these streams.	0	N.A.
Lower Ohio River	Flooding occurred early in the month as a result of late January rains, lasting one to two weeks on the lower Ohio main stem below Newburgh, Ind. Crests were generally in the range of 2 to 3 feet over flood stage although 7 feet of overflow occurred at Fords Ferry, Ky. Heavy tributary inflow from the storm of the 22d-24th caused renewed flooding late in the month which extended into March and April reaching major proportions during these months, and which will be discussed in subsequent reports.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

FEBRUARY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	WHITE BASIN		
White, Black, and Cache Rivers	Rains of around 2 inches the first two days of the month brought the Cache River back over flood stage on the 2d. It continued over flood stage the rest of the month aided by additional heavy rains on the 22d and the 23d. The latter storm dropped around 3 inches of rain over the lower Black Basin with resultant flooding thru the end of the month and a crest 7 feet over flood stage at Black Rock, Ark. The lower White River continued over flood stage from January. Flooding lasted the entire month at Augusta, Ark., aided by high releases from Bull Shoals and Norfolk Reservoirs.	0	N.A.
	ARKANSAS BASIN		
Verdigris and Neosho River Basins	Flooding continued from January on the Little Caney River and Bird Creek tributaries of the Verdigris River as discussed in the January report and lasted for the first 2 or 3 days of the month. Flooding also continued on the lower Neosho River at Commerce, Ok., from the heavy rains of late January and began at Oswego, Kansas, on the 1st. Although of short duration, the crest at Oswego of 4 feet over flood stage inundated about 25,000 acres in Oswego and Labette Counties with damage estimated at $10,000, mostly agricultural.	0	N.A.
Lower Arkansas River Basin	Light flooding occurred along the lower Poteau and the Fourche La Fave Rivers early in the month as a result of late January rainfall. The storm of the 22d-23d with rainfall of up to 3 inches caused light to moderate flooding along the lower Poteau and the Illinois Rivers with crests of about 3 to 5 feet over flood stage. The Arkansas River crested about 3 feet over flood stage at Van Buren, Ark., on the 23d and continued in flood there into March.		
	RED BASIN		
Tributaries of Middle Reach Red River	Locally heavy rainfall Jan. 30-31 of more than 2 inches caused flooding along several tributaries of the Red River in Oklahoma and Texas. Extensive lowland flooding occurred along the Sulphur River in Texas where average basin rainfall was 2.5 inches. Crests 5.5 feet over flood stage occurred at Hagansport and 10.4 feet over flood stage at Naples. However, there was little additional damage over that which was caused by earlier flooding of this area. A crest nearly 3 feet over flood stage occurred on Clear Boggy Creek at Caney, Ok.	0	N.A.
Ouachita and Black River Basins	Heavy rainfall of around 3 inches on the 1st-2d caused flooding along the Ouachita River which was most serious at Camden, Ark., where a crest 8 feet over flood stage occurred. There was minor flooding along the Sabine and Little Missouri River tributaries of the Quachita. Flooding extended downstream on the Ouachita to Monroe, La., where a crest slightly over flood stage resulted from rains of 1 to 3 inches on the 22d-23d which also caused the minor flood crest on the Black River at Jonesville, La. Flooding at Monroe continued into March.	0	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	RED BASIN-Cont'd		
	Locally heavy rainfall the first two days of the month caused severe flash, urban, and small stream flooding in many areas from extreme northwest to north central Louisiana. Flooding occurred along Dorcheat, Bodcau, and D'Arbonne Bayous and around Cypress, Caddo, Bistinneau and D'Arbonne Lakes. Parishes affected included Caddo, Bossier, Webster, Iberville, and Union. Considerable flooding of farm land occurred with evacuation of cattle. Numerous highways and secondary roads were closed for varying periods of time.		
	LOWER MISSISSIPPI BASIN		
Yazoo and Big Black River Basins	Rainfall was frequent throughout the month with monthly totals of more than 9 inches over the headwaters of the Yazoo River. Heaviest amounts occurred during the first and third weeks of the month each storm resulting in periods of flooding on the Upper Big Black River whereas the second storm extended the period of flooding on the Tallahatchie and Yazoo Rivers into March. Crests were in the range of 2 to 3 feet over flood stage along the Tallahatchie and Yazoo Rivers and 7 to 8 feet over flood stage along the Big Black. Flooding was generally confined to timber and agricultural land with logging and farming operations at a standstill during the month.	0	N.A.
Lower Mississippi River	Heavy inflow from the Ohio River caused light flooding along the upper reaches of the lower Mississippi from New Madrid to below Caruthersville, Missouri. Crest were 1 to 2 feet over flood stage early in March with flooding limited to agricultural land not protected by levees. Downstream the river rose to within 3 or 4 feet of flood stage the middle of the month.	0	N.A.
	WEST GULF OF MEXICO DRAINAGE		
Calcasieu River	Rainfall for the month ranged up to as much as 6 inches in the headwaters of the river above Hineston, La., which resulted in two periods of flooding at Hineston with crests of 2 and 3.5 feet over flood stage. No flooding occurred downstream.	0	N.A.
Sabine River	Rains of 3 to 5 inches the first four days of the month caused significant flooding along the upper Sabine River from Emory to below Longview, Texas, and along the Lake Fork tributary. Crests were generally in the range of 3 to 5 feet over flood stage. However, nearly 10 feet of flooding was reported at Gladewater, Texas. On the lower Sabine, flooding which had persisted at Deweyville since early December ended on the 2d but the river went back over flood stage on the 6th in response to rains of 1 to 2 inches over the lower Sabine. Damage was primarily to roads, bridges, and farmland.	0	N.A.
Neches River Basin	A major flash flood occurred at Nacogdoches, Texas, the night of Jan. 31-Feb. 1. Rainfall of 8.7 inches	4	5,760

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

FEBRUARY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	WEST GULF OF MEXICO DRAINAGE-Cont'd		
	was reported at the official station and an unofficial report of 13.5 inches was received. Two small creeks running thru the city overflowed causing widespread damage. About 500 residences were flooded with losses of $3 million. Damage to industrial and commercial property amounted to $500,000 and agricultural losses were estimated at $1,160,000 with 10,000 acres inundated. Other losses including public buildings, streets, utilities and railroads amounted to $1,100,000. Two periods of moderate flooding occurred on Attoyac Bayou with crests 4.9 and 3.7 feet over flood stage. Lowland flooding continued throughout the month on the Angelina River around Lufkin and the Neches River at Siboll. On the lower Neches 2 to 3 inches of rain during the first week of the month caused a crest nearly 5 feet over flood stage on Village Creek near Kountze, Texas, and aided by releases from Dam B, brought the Neches River up to flood stage at Beaumont, Texas. Lowland overflow was reported along Pine Island Bayou, and the Neches River around Evadale.		
Trinity River Basin	Significant flooding occurred along the Upper Trinity River from Crandall to Long Lake, Texas, as a result of 3 to 5 inches of rain over the headwaters during the first week of the month. Crests ranged from 5 feet over flood stage at Crandall to more than 12 feet over flood stage at Trinidad. The lower Trinity was above flood stage most of the month from Liberty to Moss Bluff due to releases from Lake Livingston which reached 37,000 c.f.s. from the 6th to the 13th. Crests were about 4 feet over flood stage.	0	N.A.
Brazos River Basin	Locally heavy rains early in the month caused moderate flooding on two tributaries of the Brazos River. The Little River crested 3.8 feet over flood stage at Cameron, Texas, as a result of releases from Lake Belton combined with runoff from rains of 1 to 2 inches. On the lower Navasota River a crest of 2.5 feet over flood stage occurred on the 6th at Bryan, Texas, where rainfall amounts of 2.2 inches on the 1st and 2.8 inches on the 4th were recorded.	0	N.A.
Guadalupe River	Rainfall of 3 to 4 inches occurred over the headwaters of the Guadalupe River the first four days of the month. The only flooding reported was on the extreme lower reach of the river from Victoria to Dupont, Texas. A crest 6 feet over flood stage occurred at Dupont where the period of flooding was extended to the 27th by releases of about 4,000 c.f.s. from Canyon Reservoir from the 11th to the 19th.	0	N.A.
	PACIFIC SLOPE DRAINAGE		
San Joaquin Basin (California)	Heavy rainfall during the early part of the month produced river levels above warning stage along the Cosumnes River. A crest of 7.8 feet occurred at Michigan Bar where the warning stage is 7.0 feet.	0	0

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

FEBRUARY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	PACIFIC SLOPE DRAINAGE-Cont'd		
Sacramento River Basin	A series of storms produced rainfall in excess of 8 inches over the headwaters of the basin during the first week of the month culminating in a period of heavy rainfall the night of the 8th which caused a strong rise along the Sacramento River. Warning stages were not exceeded along the upper portion of the river but overflow into the bypass system began at Tisdale Weir on the 8th for the first time this winter season which continued until the 22d. Overflow also occurred at Colusa Weir from the 9th to the 11th. During the week ending on the 16th rainfall of up to 8 inches again occurred over the headwaters of the Sacramento River with the river cresting at 35.9 feet at Bend Bridge and 20.9 feet at Red Bluff, both below flood stage. However, heavy inflow from Mill and Antelope Creeks, from which streams no stage reports are received, caused crests of 217 feet, 4 feet over flood stage, at Tehama Bridge and 185.2 feet, 2.2 feet over flood stage, at Vina Woodson Bridge. Flooding occurred downstream to Hamilton City where 6,000 acres were reported inundated. On the lower Sacramento, warning stages were exceeded by 3.7 feet at Ord Ferry, 2.2 feet at Colusa Bridge, and 0.9 feet at Wilkins Slough. Overflows occurred at Moulton and Colusa Weirs and were prolonged at Tisdale Weir.	0	N.A.
Central Coastal Basins in California	Monthly rainfall totals of 10 to 20 inches were reported over the Russian River Basin with somewhat lesser amounts over the Napa Basin. These amounts were generally two to three times normal and resulted from a series of four storm fronts that passed over the area during the first 13 days of February. Each storm brought significant amounts of rain. With no drying out possible, toward the end of the series, practically all the rain that fell drained into the rivers so that flooding occurred on the Russian River in the lower reaches on the 13th of the month with the river receding to below flood stage early on the 14th. The Napa River barely exceeded flood stage for approximately four hours on the 12th. Moderate rains on the last day of January and the first two days of February caused minor rises on the Russian and Napa Rivers, but both remained well below flood stage. Rains continued off and on through the 13th of the month, hitting a climax on the 12th. The Russian River did not reach flood stage in the upper portion of the River, but did exceed flood stage at the Guerneville Bridge for nearly 24 hours and at Summerhome, 3½ miles upstream from Guerneville, for over 27 hours. Peak stages were 4.5 and 6 feet above flood stage at the Guerneville Bridge and Summerhome, respectively. There was damage to summer homes along the lower Russian River. The Napa River reached flood stage at St. Helena at about 1900 on the 12th, remaining above flood stage for about 4 hours. The peak was only 0.4 foot above flood stage. Flood stage was not approached in the lower portion of the Napa River.	0	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	PACIFIC SLOPE DRAINAGE-Cont'd		
	The southern basins, Salinas and Pajaro Rivers, received moderate amounts of rain from the 1st to the 10th. Rises on the upper Salinas River were significant, reaching a peak on the 10th and 11th, but flood stages were not reached. Strangely, the peak on the lower Salinas River occurred on the 8th, but the flow was not significant. Rainfall over the Salinas River Basin ranged from a little over 3 inches at the mouth to nearly 11 inches in the upper portion. Over the Pajaro River Basin, rainfall ranged from 4 to over 7 inches. Minor rises occurred on the Pajaro River. The amounts of rain over both basins ranged from 1½ to 2 times normal.		
North Coastal Basins	Heavy snows at low elevations of 500 to 3,000 feet occurred during the first week of the month. Warm temperatures the second week led to high river stages but additional precipitation was light until most of the snow had melted from the lowlands. Rainfall in excess of 2 inches the 12th and 13th and again on the 18th and 19th caused warning stages to be exceeded on some streams. At the Dr. Fine Bridge on the Smith River the warning stage of 25 feet was exceeded by 1.3 feet on the 13th and by 3 feet on the 19th. On the Van Duzen River the warning stage of 15 feet at Bridgeville was exceeded by 0.1 foot on the 12th, and on the Eel River the warning stage of 14 feet at Fernbridge was exceeded by 4.6 feet on the 13th.	0	0
Coastal Basins in Oregon and Willamette Basin	Almost daily rains occurred over western Oregon during the first three weeks of the month with totals for the period ranging from 8 to 17 inches over the coastal area and 5 to 12 inches over the Willamette Basin. Heavy rains of 3.5 to 7.5 inches during the 9th to the 14th caused strong rises on streams in the area with the Wilson and Nehalem Rivers along the coast and the South Yamhill River in the Willamette Basin going over flood stage. Another period of heavy rain the 19th and 20th with amounts of up to 4.5 inches again caused rises on streams with the South Fork of the Coquill River going over flood stage. In all cases crests were less than 2 feet over flood stage and damage was light at this season of the year.	0	N.A.
Snake River Basin	February precipitation was 150 to 200 percent of normal over the basin. Boise, Idaho, had the greatest February total since 1940. Most of this precipitation fell from the 9th to the 13th and occurred as rain below 6,000 feet. These warm rains caused an ice breakup on the Little Wood River with backwater from an ice jam at Gooding, Idaho, flooding two basements. Emergency measures opened the channel shortly thereafter and damage was less than $200.	0	0
	PUERTO RICO		
	February rainfall totals averaged one inch - about 1.75 inches below normal. Drouth conditions continued to intensify in the south coastal area where soil moisture deficiencies were about 5 inches.

NO DATA RECEIVED

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code ·S [illegible] defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units Milli-atmo-cms.

Station	Day of month																															Mean O_3
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	

NO DATA RECEIVED

REFERENCE NOTES

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION - BY STATES: Dates in the table apply to the period 24 hours prior to time of observation. In some cases the actual occurrence is on the calendar date preceding that shown. (See individual Climatological Data for times of observations).

+	And also on an earlier date or dates.
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch of water equivalent to every 10 inches of snowfall.

CLIMATOLOGICAL DATA - METRIC UNITS: Data from airport unless otherwise specified

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile data can be evaluated.

B	Number of days maximum 21.1°C. or above for Alaskan Stations.
Y	Peak Gust
+	And also on an earlier date or dates.
U	Indicates Urban site.
R	Indicates Rural site.
0	Station pressures apply to elevations shown in the "Elevations" table of the annual issue of this publication.

Conversion formulae to English Units are as follows:

1 foot = 0.3048 meters
$F. = \frac{9}{5} \times C + 32$
1 inch = 25.4 millimeters
1 mile per hour = 0.447 meters per second

HEATING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

COOLING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

STORM SUMMARY:

°	Includes crop damage.
C	Crop damage.
*	No occurrence of storms or unusual weather phenomena reported.
+	Includes heavy sleet storm.
#	Freezing drizzle and freezing rain, commonly known as glaze.
0	For breakdown of "All Others," and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
‡	No Storm Data Report received for this State.
	Report Incomplete.
+	Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5 Million
7	$5 Million to $50 Million
8	$50 Million to $500 Million
9	$500 Million to $5 Billion.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS:

1	Flooding continued at the end of the month.
NA	Not available.

FLOOD STAGE DATA:

#	Highest Stage Observed
1/	Continued at end of month
___	Highest Stage of Record
E	Estimated
P	Provisional (Flood Stage)
U	Unknown

RAWINSONDE DATA (Average Monthly Values):

All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon. The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors. These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

*	Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.
+	Observations for these stations are scheduled at 0000 G.C.T.
†	Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

REFERENCE NOTES (continued)

SOLAR RADIATION INTENSITIES: Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

C	Clouds Present	DM	Moderate Dust	HM	Moderate Haze	SK	Slight Smoke
*	Values corresponding to true solar noon	DS	Slight Dust	HS	Slight Haze	M	Moderate Haze-indeterminable
BD	Blowing Dust	F	Fog	I	Intense haze-indeterminable		
BN	Blowing Sand	GF	Ground Fog	K	Smoke	N	Sand
D	Dust	H	Haze	KI	Intense Smoke		Slight Haze-indeterminable
DI	Intense Dust	HI	Intense Haze	KM	Moderate Smoke		

NET RADIATION: The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA: These data are from an U-V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA: The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λ_s designates the type of measurement made.

CHARTS I-IV---48

NOTE: Late reports and corrections will be carried in the June and December issues of this publication. An explanatory page "Description of Charts' will be carried in the January and July issues.

SUBSCRIPTION PRICE: $8.85 a year including annual summary; $7.75 additional for foreign mailing; 60¢ single copy; $1.65 annual summary. Make checks payable to Department of Commerce, NOAA; send payments and orders to: National Climatic Center, Federal Building, Asheville, N. C. 28801. Attn: Publications.

I cerify that this is an official publication of the National Oceanic and Atmospheric Administration and is compiled from records on file at the National Climatic Center, Asheville, North Carolina 28801.

William H. Haggard

Director, National Climatic Center

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

MARCH 1975

GENERAL SUMMARY OF WEATHER CONDITIONS

Dr. Richard E. Felch, Climatologist

HIGHLIGHTS: March lived up to the old adage of "in like a lion, out like a lamb".

Precipitation amounts ranged from 0.01 inch at Brownsville, Texas, to over 12.00 inches over most of Tennessee and parts of Kentucky, Alabama, and Mississippi. Nearly all of the Country received well above normal precipitation. The most notable exception was the southern and central Great Plains.

Temperatures over most of the Nation averaged well below normal during March. Most of Minnesota, western Wisconsin, and eastern Iowa were at least 6° below normal.

PRECIPITATION: A large stationary low off the West Coast triggered heavy rains during the first week of March. Rain and snow fell across the Great Lakes and New England as two low pressure systems swept through the area.

Extremely heavy precipitation fell over most southeastern States during the week ending on the 16th, as a combination of rain, snow, sleet, and freezing rain. At least 2 inches fell over most or all of 10 States. Over 5 inches fell in northern Mississippi and Alabama, all of Tennessee, and southern Kentucky. Two of the wettest cities were Memphis, Tenn., with 8.41, and Greensboro, N. C., with 5.15 inches for the week.

Heavy rains continued in the Deep South into the following week with 2 inches or more in southern Louisiana, Mississippi, Alabama, and Georgia. Good moisture also fell in the northern Great Plains. This moisture continued to accumulate through the end of the month. Although it fell as snow and created a number of problems, the moisture was badly needed.

Heavy rains again covered a large area of the Southeast during the closing week with at least 2 inches over parts or all of 12 States. Northern Tennessee and southern Kentucky received over 5 inches with serious flooding in some areas.

TEMPERATURE: Temperatures during the first 10 days of March averaged well below normal from the Rockies to the Atlantic. Eastern Iowa averaged at least 9° below normal, and most of the Southeast averaged at least 6° below normal.

Temperatures were well below normal over most of the Country with many areas 6° or more below normal during the week ending on the 16th. Record lows occurred the morning of the 13th, 14th and 15th in several States: Sioux Falls, S. Dak., reached -14° the morning of the 13th, Spencer, Iowa, -18°, Des Moines, Iowa, 2°, and Madison, Wis., -6°.

Temperatures changed drastically during the following week to well above normal over the entire Nation except for the western tier of States. However, temperatures began to cool sharply at the end of the week and bitter cold prevailed until the end of the month in most areas. Most States from the Dakotas to Utah averaged 13 to 18° below normal during the closing week.

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES

MARCH 1975

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MARCH 1975

Herbert J. Thompson, Office of Hydrology

Record flooding occurred during the month in two areas of the country. During the period of the 11th-14th a massive storm system moved from the south Central Plains states across the southern portion of the Ohio River Basin and the southeastern states causing major flooding - the worst in 30 years in some cases - throughout that area and along the Atlantic Coast into Virginia. The highest crest stages of record occurred on several streams, most notable of which were the Cumberland River at Williamsburg, Ky., Peachtree Creek at Atlanta, Ga., and the Red River at Port Royal, Tenn.

In the upper Mississippi Basin the rapid melting of a heavy snowpack augmented by rain caused major flooding in the upper Rock River Basin in southern Wisconsin and northern Illinois. Record crest stages occurred on the Pecatonica River at Martintown, Wis., and the Rock River at Rockton and Rockford, Ill.

The heavy inflow from the Rock River caused flooding along the upper Mississippi River, and the heavy inflow from the Ohio River caused flooding to begin along the lower Mississippi River.

Significant flooding also occurred in New Jersey, Iowa, and California, and minor flooding in several locations.

These and other hydrologic events of unusual significance or involving loss of life or property damage are discussed in more detail below.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ST. LAWRENCE DRAINAGE		
St. Clari River	An ice jam formed on the 15th which caused high water levels in the Marine City and Algonac areas. This jam was broken up on the 18th by Coast Guard icebreakers. Damage was light due to the protective works along the river.	0	N.A.
Genessee River Basin (New York)	Rainfall of around an inch on the 19th-20th combined with some snowmelt to cause lowland flooding along Oatka and Black Creeks.	0	N.A.
	ATLANTIC SLOPE DRAINAGE		
New England-New York Streams	The storm of the 19th-20th deposited moderate to heavy rain over the area with amounts ranging from 1 to 2.5 inches. Runoff from this rain and from snowmelt produced general rises on streams in the area with most of them cresting slightly below flood stage. Minor flooding occurred on the Connecticut River at Hartford, and the Pemigewassett River crested more than 2 feet over flood stage at Plymouth, N. H. Flash flood watches and warnings were issued for many portions of the area with flash flooding reported in western Massachusetts and Connecticut, in the Catskill Mountains of New York, and in local areas of Vermont, New Hampshire, and southeastern Maine, where minor ice jams compounded the problem. Damage was generally limited to flooded cellars and cars and closed roads with no lives lost.	0	N.A.
Coastal Basins in New Jersey	The storm of the 19th deposited heavy rainfall over the area with amounts of up to 3 inches. Strong rises occurred on most streams with a number of them going over flood stage. Minor flooding occurred along portions of the Wanaque, Ramapo, and Rockaway Rivers. A crest nearly 5 feet over flood stage occurred on the Pompton	0	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	River at Pompton Plains, and the Millstone River crested 1.5 feet over flood stage at Blackwells Mills. There was 3 to 4 feet of flooding along the Raritan River. The Pequannock, Saddle, and Passaic Rivers crested just below flood stage.		
Delaware River Basin	Locally heavy rainfall with amounts of 3 inches or more occurred over the lower Delaware River Basin from the storm of the 19th. Light flooding with crests 1 to 2 feet over flood stage was reported on several smaller tributaries, including Neshaminy, Chester, and Brandywine Creeks. Several other streams crested just short of flood stage, including Assunpink and Perkiomen Creeks, and the Schuylkill River at Philadelphia.	0	N.A.
Potomac River Basin	Rains of 2 to 3 inches on the 19th-20th combined with some snowmelt to produce significant flooding in the middle reach of the Potomac River. Crests in the Shenandoah Basin ranged from 3.5 to nearly 7 feet over flood stage. From 7 to 10 feet of flooding occurred along the Potomac River from Shepardstown, W. Va., to Point of Rocks, Md. Only minor flooding occurred downstream in the Washington, D. C., area. Damage was primarily to roads and bridges. Savings of $1.6 million were estimated to have resulted due to adequate warnings which permitted the removal of numerous trailers, autos, boats, and furnishings from the flood plain along the Shenandoah and Potomac Rivers and the communities of Williamsport, Brunswick, and Seneca, Md.	0	N.A.
James River Basin (Virginia)	Rains of 1 to 3 inches fell over the basin on the 13th-15th with the heavier amounts over the lower portion which resulted in flooding along the Appomattox and lower James River. Crests were in the range of about 2 to 4 feet over flood stage. On the 17th rainfall averaging about 1.5 inches occurred over the lower end of the basin causing a second crest at Richmond. These two storms caused saturated soil conditions and high river levels prior to the storm of the 19th-20th which deposited rainfall of up to more than 4 inches over the basin with the heaviest amounts over the middle portion. Serious flooding resulted along the James River at and below Scottsville. Crest stages of up to 15 feet over flood stage were reported. Damage to agriculture and highways was extensive. In Richmond a mile square area of the city was inundated by up to 8 feet of water with about 50 businesses affected. Serious flooding also occurred along the Rivanna River with a crest 9 feet over flood stage at Palmyra. Among the counties suffering losses were: Albemarle, $43,000 of which $16,000 was to highways; Goochland, $85,000, of which $60,000 was to highways; and Nelson, $30,000 to roads. Minor flooding occurred in the upper James Basin.	0	1,200

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

Basins and Streams	FLOOD EVNET	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
Roanoke, Tar, Neuse, and Cape Fear River Basins	Major flooding occurred on these streams during March with near record crest stages reported at some points. Monthly rainfall totals were generally well above normal, with Raleigh-Durham reporting 3 inches above normal. There were several periods of heavy rain during the month but the flooding was primarily the result of the storm of the 13th-14th which deposited amounts ranging up to 7.5 inches with the heaviest amounts in the mountainous headwaters. The other periods of rain with amounts 0.5 to 2.5 inches occurred on the 17th, 19th, 25th, and 30th which caused additional crests on some smaller headwaters streams but generally served to augment and prolong flooding on the major streams. The principal exception was in the Roanoke Basin where 3.5 inches of rain on the 30th over the upper Dan River caused the highest crest of the month at Danville, Va., 6.6 feet over flood stage, and on the middle Roanoke River where the highest crests, 6 to 8.5 feet over flood stage, resulted from the storm of the 19th. Elsewhere in the Roanoke Basin the Dan River had a crest 11.7 feet over flood stage at Paces, Va., on the 15th while flooding on the lower Roanoke River, which is controlled by reservoirs, extended into April with the crests in April. The level of Kerr Reservoir on the Roanoke reached 316.8 feet - the highest level ever recorded and only 3.2 feet below the top of the dam. Crests along the Tar River ranged from 2 to more than 8 feet over flood stage with the crest at Louisburg equalling that of Feb. 1973, which was the highest since 1955. Downstream on the Tar River crests were the highest since at least 1964. Crests along the Neuse River were in the range of 7.5 to 10.5 feet over flood stage and were also the highest since at least 1964. Along the Cape Fear River crests ranged from 6 to 14 feet over flood stage but were generally lower than those of 1973. Numerous evacuations of homes and extensive damage occurred along these streams ranging into the hundreds of thousands of dollars. Losses of $22,000 have been reported at Danville, Va., on the Dan River and $250,000 at Weldon, N. C., on the lower Roanoke River, where 600 acres were inundated.	0	N.A.
Yadkin-Pee Dee River Basin	Monthly rainfall totals ranged from 4 inches along the coast to 11.5 inches in the headwaters of the basin. During the four-day period ending on the 14th, 4 to 5 inches of rain fell over the Yadkin Basin causing significant flooding with a crest 8.5 feet over flood stage at Yadkin College, N. C. The Rocky River crested 13 feet over flood stage at Norwood, N. C., with losses estimated at $3,000, mainly agricultural. Downstream on the Pee Dee River this storm caused a crest nearly 12 feet over flood stage at Cheraw, S. C., and 8 feet over flood stage at Pee Dee, S. C., where the crest stage of 27.81 feet was the highest stage recorded		

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	since 1945. Losses were estimated at $20,000 to livestock and wages of logging crews. Savings from warnings were estimated at $50,000. Rains of 1 to 2 inches occurred on the 19th and 20th over much of the Basin, with about 3 inches over the Lumber River where flooding had continued from February and lasted into April with another crest 4 feet over flood stage at Lumberton, N. C., on the 21st from this storm. There were some evacuations at Lumberton with losses estimated at $7,000. Minor flooding occurred along the Lynches River. Rainfall amounts of 1 to 2 inches on the 24th and 25th combined with inflow from the Lumber River caused minor flooding along the Little Pee Dee River. Headwater areas received 1.5 to 3.5 inches of rain the 29th and 30th which caused another crest 7 feet over flood stage at Yadkin College on the Yadkin River. Losses along the Yadkin River from the several periods of flooding were estimated at $20,000. Flooding also continued into April on the Little Pee Dee and lower Pee Dee Rivers.		
Santee River Basin	Serious flooding occurred in the basin - the worst since the 1940's at some points. Most of the flooding was due to a four-day period of rainfall the 11th to the 14th, which totaled as much as 9.5 inches over the mountainous headwaters. However, locally heavy rain on the 25th and 26th caused minor flooding on portions of the Broad and Saluda Rivers. In the Broad River Basin rainfall from the storm of the 11th-14th ranged from 4.5 inches over the lower portion to 8 inches over the headwaters. The crests of 4.6 feet and 16.4 feet over flood stage at Gaffney and Blair, S. C., respectively, were the highest stages recorded since 1964. Damage was estimated at $60,000, with $30,000 of this at a Burlington Mills plant at Henrietta, N. C. Savings from warnings were estimated at $120,000. In the Saluda River Basin rainfall from the storm of the 11th-14th ranged from 5.5 to 9.5 inches over the mountainous areas. The crest stage of 25.0 feet, 11 feet over flood stage, at Chappells, S. C., was the highest since the 28.7 feet stage recorded in 1940. Losses of $5,000 to livestock occurred with savings estimated at $25,000. Minor flooding occurred along the Reedy River tributary with Cleveland Park and streets in Greenville, S. C., inundated. Rainfall was light over the Congaree River reach, totaling only 1.7 inches for the storm at Columbia, S. C. However, the heavy inflow from the Broad and Saluda Rivers caused a crest 7.5 feet over flood stage at Columbia which was the highest since 1964. Flooding of the River Park subdivision south of Cayce, S. C., caused losses of $5,000. Flooding of agricultural land below Columbia caused losses of $45,000 to small grains. Savings from evacuation of livestock and equipment were estimated at $100,000. Rainfall	0	360

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MARCH 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	along the Catawba-Wateree River ranged from 4 to over 6 inches for this storm. This stream is heavily regulated by a series of dams and reservoirs. Lookout Shoals Reservoir which has no flood gates, was rapidly filled by releases from upstream reservoirs and reached a stage 6 feet over full lake level with some flooding of cabins and installations along the shore. About 50 cabins and trailers were evacuated below this reservoir. Below Mountain Island Lake 30 homes were flooded. Damage was estimated at $110,000. On the South Fork Catawba River a crest of 5 feet over flood stage occurred at McAdenville, N. C., with two warehouses successfully evacuated. Savings along the South Fork were $110,000. Downstream, on the Wateree River, Lake Wateree, which also has no flood gates, reached a stage 5.6 feet over full lake level with damage of $100,000 to cabins and other shoreline installations. This was the highest lake level since 1967. Below Lake Wateree, agricultural lowlands were flooded around Camden, S. C., where a crest of 7.5 feet over flood stage occurred, also the highest since 1967. Losses to small grains and livestock were estimated at $15,000 with savings of $135,000. Downstream on the Santee River Lake Marion was drawn down by 2.7 feet in preparation from the heavy inflow from upstream. Discharge from Lake Marion peaked at 97,400 c.f.s. on the 19th which caused extensive lowland flooding and a crest at Jamestown, S. C., 11.3 feet over flood stage which was higher than that which occurred in 1964 and one of the highest since the dam was built in the 1940's. Losses were estimated at $20,000 and savings at $120,000. Total savings from flood warnings in the Santee Basin were $660,000.		
Savannah River Basin	Flooding continued from January at Clyo, Ga., and from February near Millhaven-Wade, Ga., ending there on the 10th. Rainfall was somewhat above normal for the month with heavy amounts on the 13th and 14th which caused minor flooding to begin at Augusta, Ga., and renewed flooding near Millhaven-Wade where a crest 4 feet over flood stage occurred the 27th to 28th. At Clyo, Ga., flooding lasted throughout March and into April with a crest 6.8 feet over flood stage the end of March. Damage for this prolonged period of flooding was estimated at $160,000 by the Corps of Engineers and was entirely agricultural.	0	160
Ogeechee, Altamaha, and Satilla River Basins	Monthly rainfall totals were near normal over the lower portions of these basins and 1 to 2 inches above normal over the middle and upper areas. Rainfall was frequent during the month with heavy amounts of one inch or more reported over part of the area on the 14th, 17th, 19th, and 24th. Light flooding occurred again this month with crests of 3 feet over flood stage on the lower Ogeechee, more than 5 feet over flood stage on the upper Ocmulgee, from 4 to nearly 9 feet over flood stage	0	81

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	along the Oconee, and 3 to 6 feet along the Altamaha River. The upper Satilla River just reached flood stage. Flooding extended into April along portions of the Ogeechee and Altamaha Rivers with damage for the January to April period estimated at $81,000 by the Corps of Engineers, all of which was agricultural.		
Appalachicola River Basin	Serious flash flooding occurred in the Atlanta, Ga., area on the 13th as several days of rain culminated in amounts of more than 2 inches over the area. Extensive damage, estimated at $1.7 million, was done to homes, apartments, and automobiles. A record stage of 19.4 feet, 6.4 feet over flood stage, occurred on Peachtree Creek and other streams in the Atlanta area also flooded. The Chattahoochee River crested 3.2 feet over flood stage at Atlanta. Downstream on the Appalachicola River flooding continued from February at Blountstown, Fla., ending on the 6th. However, the storm of the 13th caused renewed flooding there and augmented by heavy rains the 17th to 18th the river crested 7.7 feet over flood stage on the 22d. Flooding continued into April. Damage along the Chattahoochee from the several winter periods of flooding was estimated at $277,300, all agricultural. Serious flooding occurred again this month along the Flint River as a result of the above normal rainfall. Crest stages ranged from 3 feet over flood stage downstream to about 10 feet over flood stage in the upper reaches. Damage from the several periods of winter flooding in the Flint Basin of which this month's was the greatest, totaled $306,900. This included $116,500 to agriculture, $20,700 to transportation facilities, and $169,700 urban.	0	2,284
Alabama River Basin	Rains of at least 2 to 3 inches in amount fell over the basin on the 13th and similar amounts occurred again during the 16th to the 19th. Minor flooding occurred on the Etowah River in Georgia. No flooding was reported along the Coosa River. However, 4 to 5 feet of overflow occurred along the lower Tallapoosa River when the flood gates for Martin Dam were raised on the 16th. Downstream on the Alabama River crests of about 2 to 3.5 feet over flood stage occurred along the upper reach while crests of 6 to 8.5 feet over flood stage occurred along the lower reach. Flooding was generally confined to agricultural land. Damages along the Etowah River for the January to March period have been estimated at $24,500.	0	N.A.
Tombigbee-Black Warrior River Basin	Rainfall was much above normal over the basin during March with monthly totals in excess of 15 inches recorded over the headwaters of the Tombigbee. Much of this rain fell on the 13th with amounts of nearly 7 inches over the lower Black Warrior River decreasing to about 5 inches upstream. Amounts of 5 to 8 inches occurred over	0	3,678

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	the middle and upper reaches of the Tombigbee from this storm. Intensities were high with rates of 2 inches per hour at several points. Two inches in 20 minutes were reported at Tuscaloosa, Ala., where severe flash and urban flooding occurred, blocking 30 to 40 streets and necessitating the evacuation of several families from a trailer park in the Northport area. Urban flooding was also reported in Sumiton, Fayette, Warrior, and Folkville, Ala. Flash flooding also occurred in Birmingham and at Courtland, Ala., where 5 families were evacuated. Moderate flooding occurred along the lower reach of the Black Warrior River with crests 5 to 7 feet over flood stage. Damage to agricultural land was estimated at \$297,600, while damage to recreational facilities along the river amounted to \$63,700.		
	Major flooding occurred in the Tombigbee Basin. Crest stages at Aberdeen and Columbus, Miss., were within 2 feet of those reached in March 1973 which was the flood of record at those points. Along the main stem of the Tombigbee crests were in the range of 9 to more than 14 feet over flood stage. In Mississippi there was widespread damage to roads and bridges, nearly 1,300 people were evacuated and total losses were estimated at \$1,831,900. On the main stem of the Tombigbee losses totaled \$1,533,000, including \$354,300 to agriculture, \$119,700 to transportation facilities, and \$1,059,000 urban. On the East Fork of the Tombigbee with a crest 5 feet over flood stage at Fulton, Miss., losses totaled \$298,900 including \$223,900 to agriculture, \$42,400 to transportation facilities, and \$32,600 urban industrial. In Alabama total damages were estimated at \$1,484,900 in the Tombigbee Basin with \$1,346,200 to agriculture, \$127,000 to roads, and \$11,700 urban. On the 30th-31st rains of 2 inches or more over the headwaters caused the upper Tombigbee to return to flood condition with crests 3 to 6 feet over flood stage which continued into April. Flooding lasted into April on the lower Tombigbee also.		
Pascagoula River Basin	Monthly rainfall averaged about 15 percent above normal with rains of up to about 3 inches on the night of the 18th-19th causing minor flooding on Tallahala Creek and the Leaf River in the headwaters of the basin. Damages were estimated at \$5,200 to agriculture and \$16,000 to recreational facilities along the streams.		21
Pearl River Basin (Mississippi)	The flooding which continued from February on the Pearl River at and below Jackson had ended by the 12th. However, heavy rainfall of 5 to 8 inches over the upper part of the basin during the period of the 10th-14th brought the river back over flood stage thru the end of the month with amounts of an inch or more on the 17th, 19th, and 30th contributing to the flooding. Crests were a little higher than those which occurred in February and were generally in the range of 3.5 to 5.5 feet over		704

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MARCH 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	flood stage. However, more than 14 feet of flooding occurred around Jackson and less than 2 feet at Columbia. Losses were estimated at $316,400 to agriculture, $340,800 to transportation facilities, and $47,000 urban. Two lives were lost at Byram when a small boat was capsized by the flood waters.		
	UPPER MISSISSIPPI BASIN		
Mississippi River tributaries in southern Wisconsin, N.E. Iowa, and N.W. Illinois	A heavy snow cover of 10 to 20 inches had accumulated over this portion of the basin by early March. Unseasonably warm temperatures the middle of the month caused a rapid melt of this snow cover with the runoff augmented by rains averaging more than an inch on the 22d. The most serious flooding occurred in northwestern Illinois. Crests of 4 to 9.5 feet over flood stage were reported along the Pecatonica River with record flooding at Martintown, Wis. More than 200 families were evacuated at Freeport. This heavy inflow from the Pecatonica helped to cause record flooding on the Rock River at Rockton and Rockford, Ill. The crest of 15.54 feet at Rockton exceeded the old record of 14.6 feet which occurred in 1937 by 0.9 feet and the crest at Rockford of 15.7 feet was 0.2 foot higher than the old record of 15.5 feet which occurred in 1973. On the lower Rock River flooding was less severe with crests of 2 to 4 feet over flood stage. Widespread evacuation of residents of many unincorporated areas between Loves Park and Shirland, Ill., occurred with 380 homes affected. The most seriously affected area was the community of North Park with three-fourths of the residential area flooded. More than 2,000 people were evacuated in the Rockford area with estimates of losses running as high as $10 million. Significant flooding also occurred on the Apple and Plum Rivers - minor tributaries of the Mississippi in northwestern Illinois. Flooding on the lower Pecatonica and along the Rock River continued into April. In northeastern Iowa losses were not heavy at this season of the year. However, crests of 4 feet and 6.6 feet over flood stage occurred on the Turkey River at Garber and the Maquoketa River at Maquoketa, respectively. Minor flooding occurred along the lower Wapsipinicon River which continued into April. Minor flooding also occurred on the Kickapoo River in southwestern Wisconsin.	0	N.A.
Iowa, Skunk and Des Moines River Basins (Iowa)	Rapid melting of an 8 to 12 inch snow cover augmented by rains of 0.5 inch on the 22d and 27th caused light flooding on several tributaries of the Cedar River, which is a major tributary of the Iowa River. A crest 4 feet over flood stage occurred on Blackhawk Creek at Hudson and nearly 5 feet of flooding on the lower Cedar River. The most significant flooding was on the Iowa River from above Marshalltown to Coralville Dam with crests of 4 to 5 feet over flood stage. Minor flooding occurred along the lower Iowa River and the English River, a tributary. Minor to moderate flooding	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	UPPER MISSISSIPPI BASIN-Cont'd		
	occurred in the Skunk River Basin with a crest 3.7 feet over flood stage on the South Skunk at Oskaloosa, and the Des Moines River Basin with crests 1 foot and 3.7 feet over flood stage on the North Raccoon River at Jefferson and the North River at Norwalk, respectively. This flooding generally affected farmland with losses light since crops had not yet been planted.		
Illinois River	Flooding continued on the lower Illinois River from February ending by the 20th. Crests occurred early in March and were in the range of 2 to 4 feet over flood stage. Rains of 1 to 2 inches over the lower portion of the basin on the 27th-29th brought the river back over flood stage at Beardstown on the 30th with flooding into April.	0	N.A.
Meramec River Basin	Precipitation totaling 2 to 3 inches during the period of the 9th-13th caused a brief period of minor flooding on the Bourbeuse and Big River tributaries the middle of the month. Amounts of more than 2 inches the 27th-29th caused flooding along the lower Meramec River which continued into April with crests in April.		
Upper Mississippi Main Stem	The heavy inflow from tributaries due to snowmelt runoff, particularly the Rock River, caused minor to moderate flooding along most of the Mississippi River from Keithsburg, Ill., (below the mouth of the Rock River) down to Alton, Ill. (Dam 26). Crests were in the range of 1-4 feet over flood stage. Flooding continued into April below Hannibal, Mo. Flooding began on the 29th in the reach from Cape Girardeau, Mo., to the mouth of the Ohio River with crests in April. The navigation season on the upper Mississippi opened at Guttenberg, Iowa, on the 2d, on the 19th-20th at La Crosse, Wis., and on the 22d at St. Paul, Minn.	0	N.A.
	MISSOURI BASIN		
Lower Missouri Tributaries	A period of unusually warm temperatures the middle of the month caused rapid melting of most of a heavy snow cover which amounted to 14 inches over much of the Floyd River Basin. Flooding of farmland was reported around Alton, Iowa, with a crest 2.5 feet over flood stage there. Snowmelt runoff combined with an ice jam caused minor flooding on the Platte River at Grand Island, Nebr., the first of the month. Snowmelt runoff also caused minor flooding on the Nishnabotna River around Hamburg, Iowa, and the Chariton River around Chariton, Iowa. There was little damage at this season of the year.	0	N.A.
	OHIO BASIN		
Mahoning River Basin	Rain of about one inch combined with snowmelt to cause a rise on the Mahoning River which crested slightly over flood stage at Youngstown, Ohio, on the 20th. Damage was light.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MARCH 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	OHIO BASIN-Cont'd		
Guyandotte-Big Sandy River Basins	Monthly rainfall was much above normal with totals of over 11 inches reported at several points. There were four periods of heavy rainfall. Amounts of 1 to 3.5 inches on the 12th-13th and 2.3 to 3.3 inches on the 27th-29th caused periods of flooding on the Guyandotte and Tug Fork Rivers. Crests of 2.7 and 1.9 feet over flood stage occurred on the Guyandotte River at Branchland, W. Va., with light damage. On the Tug Fork of the Big Sandy River a crest 4 feet over flood stage at Williamson, W. Va., caused damage of $27,750 during the first period of flooding. A crest 5.2 feet over flood stage occurred during the second period of flooding on the Tug Fork at Williamson with damage estimated at $447,000 by the Corps of Engineers. Families were evacuated from the town of Chattaroy, W. Va., on the Tug Fork during both periods of flooding. At Olive Hill, Ky., 300 people were evacuated and 42 houses flooded on the 14th.	0	475
Scioto River (Ohio)	The major flooding in late February ended during the first two days of March on the lower Scioto. While March rainfall over the upper portion of the basin above Columbus was only 90 percent of normal, rainfall over the basin below Columbus was 130 percent of normal with amounts of 1 to 2 inches on the 12th-14th, 19th-20th, and 29th-30th causing minor flooding on the lower Scioto.	0	225
Ohio River Tributaries in Kentucky	Major flooding occurred on several streams as a result of the storm of the 12th-14th with a record crest stage at Williamsburg on the Cumberland River and record flooding on the lower Cumberland and Tennessee Rivers and some of their tributaries from which reports are not received, including the Little River above Cadiz. The crest stage of 34.53 feet at Williamsburg exceeded the record stage of 34.2 feet which occurred in 1946. A stage of 38.0 feet was believed to have occurred in 1886 before records began there. Flood stage at Williamsburg is 21 feet. A near Record stage was reported at Barbourville also on the Cumberland River. At Nashville, Tenn., the Cumberland River flooded the basement of the Grand Old Opry House with the crest of 47.6 feet, the highest regulated stage of record. The heaviest rainfall occurred over the western part of the state with 8 inches reported on the 12th over the headwaters of the Clark River where one of the worst floods on record occurred. Flash flooding was reported over much of the state with the communities of Hopkinsville in the headwaters of the Little River and Fulton and the counties of Calloway, Marshall, and Groves particularly affected. Minor flooding of up to 5 feet occurred on the Licking River from Salyersville to Cave Run, with a crest 2.3 feet over flood stage at Salyersville. Moderate flooding of 8 to 9 feet occurred on the North Fork of the Kentucky River from Jackson to	3	20,000

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	OHIO BASIN-Cont'd		
	Beattyville and on the lower Kentucky River at Lockport, where a crest 6.5 feet over flood stage occurred. Flooding along other portions of the Kentucky River was minor. Major flooding occurred on the Barren River with a crest 14.8 feet over flood stage at Bowling Green and on the Green River from Munfordville through Woodbury Lock with crests of 17.7 feet over flood stage at Munfordville and more than 14 feet over flood stage at Brownsville and Woodbury. Damage along the Barren and Green Rivers was estimated at $1,869,000 by the Corps of Engineers with 101,000 acres inundated. Rainfall of over 3 inches occurred again over much of the state the 28th-29th with flooding recurring along the Licking, Lower Kentucky, Brashears Creek, Rolling Fork, and portions of the Cumberland River which in many cases was more severe than that which occurred earlier in the month. Eleven counties of western, south central, and southeastern Kentucky were declared disaster areas. Major flooding occurred on tributaries of the Cumberland River in Tennessee. A record crest of 47.7 feet was observed on the Red River at Port Royal exceeding the previous record of 44.4 feet in 1937. A crest 14 feet over flood stage occurred on the Harpeth River at Kingston City.		
Wabash River Basin	Flooding continued from February on the Embarras, Skillet Fork, Little Wabash, and the lower half of the White and main Wabash Rivers. Crests generally occurred late in February except for the lower Wabash and extreme lower White River, which crested early in March. This flooding had ended at all points in the basin except the lower Little Wabash by the 10th. Precipitation was much above normal over the lower portion of the basin during March with totals ranging up to over 10 inches along the Ohio River. The 7.2 inches total at Evansville was 2.5 inches above normal there. Some of this precipitation fell as snow with the 13.3 inches recorded at Evansville the third highest March total there in this century. However, no snow remained on the ground at the end of the month. Amounts of 2 to 3 inches on the 9th-14th and 3 to 4 inches the 28th-29th over the lower basin caused additional periods of flooding on these streams except for the main Wabash above the mouth of the White River. Crests from these later periods of flooding were substantially lower than those of the late February-early March flooding which caused the major damage and which in the White Basin were the highest since 1969. Losses from the prolonged flooding were estimated at $2,115,000 along the Wabash River with 208,000 acres inundated; $1,100,000 along the Embarras River with 42,000 acres affected; $1,700,000 along the main White River with 58,000 acres flooded; $1,100,000 along the East Fork of the White River with 85,000 acres flooded; $1,142,000 along the Little Wabash with 96,000 acres affected; $264,000 along the Skillet Fork with 37,000 acres inundated; $740,000 along	0	8,181

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	OHIO BASIN-Cont'd		
	the Eel River with 28,000 acres inundated; and $20,000 on Raccoon Creek with 2,000 acres affected.		
Tennessee River Basin	Rainfall amounts over the headwaters of the Tennessee River for the storm of the 13th-14th ranged up to the 7.5 inches reported at Hendersonville, N. C., with 3 to 4 inch amounts common. Flooding occurred along the French Broad River below Rosman, N. C., with crests of around 1.5 to 4.5 feet above flood stage. Downstream, major flooding occurred on the lower Tennessee from Decatur, Ala., to Savannah, Tenn., with crests of 7 to 11 feet over flood stage. Major flooding occurred on several tributaries including the Emory, Elk, and Duck Rivers and South Chickamauga Creek. The crest on the Duck River at Columbia, Tenn., of 48.3 feet was the highest since the record flood of 1948 which reached a stage of 51.8 feet. Flood stage at Columbia is 32 feet. Rainfall amounts in excess of 7 inches in 24 hours with storm totals considerably higher caused this flooding. Late in the month rainfall of 4 inches or more caused another period of flooding on South Chickamauga Creek and prolonged the flooding on the Tennessee River into April.	0	N.A.
Ohio River Main Stem	Flooding caused by the heavy rains in late February continued into March at most points at and below Cannelton, Ky., ending by the 11th at all points except Fords Ferry, Ky., and Cairo, Ill., which were above flood stage all of March. Crests which occurred early in March at most stations were generally in the range of 4 to 7 feet over flood stage altho more than 11 feet of flooding was reported at Shawneetown, Ill. The heavy tributary inflow from the storms of the 13th-14th caused a return to flood conditions generally by the 15th as far upstream as McAlpine Dam, Ky., which, aided by the storm of the 28th and 29th, generally lasted into April with the major crest early in April.	0	N.A.
	WHITE BASIN		
Black, White, and Cache Rivers	Flooding continued from February on the lower Black River, the Cache River at Patterson, and the White River at Augusta. The White River below Augusta went over flood stage early in the month in response to late February rainfall which made increased reservoir releases necessary. March rainfall totals were from 7 to 9 inches above normal with much of this occurring on the 26th-29th. Storm totals were generally in the range of 6 to 7 inches with Corning, Ark., receiving 9.16 inches during the four day period. The White River rose 12 feet in 12 hours at Batesville, Ark., cresting 10.5 feet over flood stage. The Black River crested nearly 14 feet over flood stage at Black Rock, the fourth highest stage of record and 4.0 feet below the record crest in 1915. Crests along the lower White River occurred early in April and were about 7 to 9 feet over flood stage. Considerable northeastern	0	2,658

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MARCH 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	WHITE BASIN-Cont'd		
	Arkansas farmland was covered with water with 292,000 acres inundated. The Cache River was 5 miles wide at some points. About 45 percent of the damage was agricultural, primarily to crops. Large numbers of livestock were saved by flood warnings. The remaining damage was largely public property and residential with 321 homes inundated.		
	ARKANSAS BASIN		
Middle Arkansas River Basin (Oklahoma)	Precipitation averaged about 2 inches above normal over east central and northeast Oklahoma during March. Heavy local showers on the 18th-19th caused minor flooding along the Illinois and Fourche La Fave Rivers and heavier rainfall on the 27th-28th caused more widespread small stream flooding. Minor flooding occurred on the Little Caney, Lower Neosho, Illinois, and Little Rivers and on Polecat and Bird Creeks. More significant flooding occurred on the Deep Fork, Poteau, and Fourche La Fave Rivers and Petit Jean Creek. A crest 7 feet over flood stage was observed on the Fourche La Fave River at Houston. Flooding on the Arkansas River at Van Buren, Ark., which had ended early in March recurred near the end of the month with a crest about 3 feet over flood stage on the 29th.	0	N.A.
	RED BASIN		
Red River tributaries in Oklahoma	Heavy local rainfall caused Clear Boggy Creek to go over flood stage on three occasions during the month with the most significant flooding near the end of the month when a crest 3 feet over flood stage occurred at Caney. The Blue River also reached flood stage at Blue on the 29th.	0	N.A.
Sulphur River	Frequent showers with three periods of rain of more than an inch on the 9th-10th, 13th-14th, and 27th-28th caused minor flooding on the upper Sulphur River. Downstream at Naples a crest 4 feet over flood stage occurred on the 19th.	0	N.A.
Ouachita-Black River Basin	Rainfall during March totaled as much as 10 inches with the heaviest amounts on the 13th-14th and the 27th-28th. Some flooding occurred in the basin with a crest 3 feet over flood stage on the Saline River at Benton, Ark., on the 29th and crests of 3.7 and 4.7 feet over flood stage on the Ouachita River at Camden, Ark. Minor flooding occurred below Camden down to Columbia, La. Flooding began at Jonesville Lock on the Black River on the 14th and extended into April.	0	N.A.
Lower Red River	Flooding of unprotected areas was reported along the lower Red River beginning about the 15th and continuing into April. There are no reporting stations along this reach of the river.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MARCH 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	LOWER MISSISSIPPI BASIN		
Mississippi tributaries in Tennessee	Major flooding struck western Tennessee as a result of the heavy rains of the 13th-14th with amounts of up to at least 8 inches reported for the storm. Flooding is rather rare in this area. The reporting network is not well developed and much flood data is not available. On many smaller streams flood stages have not yet been defined. However, it appears that flooding occurred on nearly all streams in the area. Crests more than 10 feet over flood stage occurred on the Obion River and the North and South Forks of the Forked Deer River. Damage in Union City in the Obion River Basin was estimated at $500,000 with 15 homes evacuated. In the Forked Deer River Basin 5 families were evacuated at Dyersburg with $50,000 damage. At South Fulton in the Hatchie River Basin 1,000 people were evacuated with losses of $2 million. Flooding was also reported on the Loosahatchie, and Wolf Rivers and on Nonconnah Creek. The storm of the 27th-29th also caused flooding on most of these streams of somewhat lesser magnitude.	0	3,000
St. Francis River	The St. Francis River was reported to be over flood stage the entire month caused by the same storms that affected the White River Basin discussed above with the storm of the 26th-29th producing the crest nearly 6 feet over flood stage on the 29th. Much farmland was flooded with the river 4 to 5 miles wide at some points.	0	N.A.
Yazoo-Big Black River Basin	Flooding continued from February along portions of the Tallahatchie-Yazoo River ending by the 8th. March rainfall was well above normal reaching 180 percent of normal over much of the Yazoo Basin and the middle portion of the Big Black Basin. Most of this rain occurred during the period of the 10th-14th with 5-8 inch rains over this area. Although crests of 9 to 10 feet over flood stage occurred along the Big Black River with losses estimated at $200,000, the major damage occurred in the lower Yazoo Basin with backwater from the flooding Mississippi River a primary contributing factor. By the end of March more than 570,000 acres of fertile farmland were under water with about 90 percent of Sharkey and Issaquena Counties flooded. Between seven and eight hundred families were evacuated from the flooded area which continued to increase into April.	0	17,900
Lower Mississippi-Atchafalaya River	Minor flooding continued from February in the New Madrid to Caruthersville reach ending by the 12th. Heavy inflow mainly from the Ohio River, discussed above, caused flooding at most points from Caruthersville, Mo., down to Donaldsonville, La., by the end of March. This flooding continued into April with crests reached in April. Flooding continued on the Atchafalaya River at Morgan City, La., the entire month.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MARCH 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	WEST GULF OF MEXICO DRAINAGE		
Calcasieu River Basin	Rainfall over the headwaters of the basin during March ranged from 5 to as much as 7.5 inches at Slagle, La., with amounts of over an inch on the 5th and 13th causing periods of flooding at Hineston, La., with a crest 3.6 feet over flood stage on the 21st.	0	N.A.
Sabine, Neches and Trinity River Basins	Rainfall of 1 to 4 inches occurred during March with locally heavy amounts on the 13th and 14th causing some flooding on the upper Sabine and headwaters of the Trinity River. A crest 3 feet over flood stage occurred at Mineola, Texas, on the Sabine River. Otherwise flooding was minor. In the Neches Basin, the Angelina River at Lufkin and the Neches River at Diboll, Texas, continued out of banks the entire month. Minor flooding continued from February on the lower Sabine at Deweyville and the lower Trinity at Moss Bluff due to releases from Toledo Bend Reservoir and Lake Livingston respectively.	0	N.A.
	PACIFIC SLOPE DRAINAGE		
San Joaquin River Basin	Heavy rains the last two weeks of the month caused warning stages to be reached or exceeded on the Mokelumne River at Thornton, Calif., and the Cosumnes River at Michigan Bar and McConnell, Calif.	0	0
Sacramento River Basin	A series of storms with heavy precipitation crossed northern California during March. Monthly totals ranged from 150 to 300 percent of normal. Many stations reported the heaviest March precipitation of record. During the week ending on the 9th precipitation totals ranged up to over 4 inches with the heaviest amounts on the 7th producing a strong rise on the upper Sacramento which crested 2 feet below flood stage at Tehama Bridge. During the week ending on the 23d precipitation totals ranged up to more than 6 inches with the heaviest amounts the 17th-19th and 20th-22d causing crests of 1.6 and 2.6 feet over flood stage at Tehama Bridge. During the week ending on the 30th precipitation totaling up to more than 4 inches occurred with most of it on the 24th-25th. Flood stage was again exceeded at Tehama Bridge, in this case by 1.5 feet. No other station went over flood stage but warning stages were exceeded at several points from Hamilton City to Fremont. Overflow into the bypass system occurred at all fixed weirs during the last half of the month. Damage was limited to low-lying farm land and some road systems.	0	N.A.
Central Coastal Basins in California	A series of storms during March produced monthly precipitation totals of more than 200 percent of normal over the area. Heavy rain was reported on the 2d, 7th, 10th, 14th, 16th, 22d, and 25th with rises on streams in the area on each occasion. The Napa River crested 2 feet over flood stage on the 21st. Flood stages were not exceeded on the Russian, Pajaro, and Salinas Rivers altho the Russian River crested about one foot below flood	[illegible]	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	PACIFIC SLOPE DRAINAGE-Cont'd		
	stage on the 22d.		
Eel River	Serious flooding occurred during March along the Eel River as a result of the series of storms discussed above. No stage data is available at this time.	0	500
Coastal Basins in Oregon	Frequent rains occurred during the month with heaviest amounts on the 18th and 24th. The storm of the 18th deposited up to 6 inches of rain over the area with the South Fork of the Coquille River cresting 2.0 feet over flood stage at Myrtle Point. The storm of the 24th left amounts of up to 4 inches over the area with the South Fork of the Coquille River again exceeding flood stage this time by 0.7 foot. Strong rises occurred on all streams but no other streams exceeded flood stage altho the Rogue River crested 0.5 foot below flood stage at Grants Pass on the 18th. Damage was confined to low-lying pasture lands and secondary roads.	0	N.A.
Willamette Basin	Precipitation occurred on about half of the days during March with the wettest period on the 16th-20th when 5-7 inches fell over northwestern Oregon. Rises occurred on all streams but only Johnson Creek went slightly over flood stage.	0	5
	PUERTO RICO		
	Rainfall over the Island was near normal with an average of 2.80 inches. Most of this occurred in two periods the 3d-4th, and 8th-9th. Several stations in the interior reported 24-hour totals of 4-5 inches which caused some local urban flooding. However, soil moisture deficiencies ranging up to 4.5 inches were apparently enough to prevent significant stream runoff.

REFERENCE NOTES

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION - BY STATES Dates in the table apply to the period 24 hours prior to time of observation. In some cases the actual occurrence is on the calendar date preceding that shown. (See individual Climatological Data for times of observations).

+	And also on an earlier date or dates.
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch of water equivalent to every 10 inches of snowfall.

CLIMATOLOGICAL DATA - METRIC UNITS: Data from airport unless otherwise specified.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile data can be evaluated.

B	Number of days maximum 21.1°C. or above for Alaskan Stations.
Y	Peak Gust.
+	And also on an earlier date or dates.
U	Indicates Urban site.
R	Indicates Rural site.
Ø	Station pressures apply to elevations shown in the "Elevations" table of the annual issue of this publication.

Conversion formulae to English Units are as follows:

1 foot = 0.3048 meters
°F. = $\frac{9}{5}$ x C + 32
1 inch = 25.4 millimeters
1 mile per hour = 0.447 meters per second

HEATING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

COOLING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

STORM SUMMARY:

°	Includes crop damage.
C	Crop damage.
*	No occurrence of storms or unusual weather phenomena reported.
@	Includes heavy sleet storm.
#	Freezing drizzle and freezing rain, commonly known as glaze.
Ø	For breakdown of "All Others," and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
‡	No Storm Data Report received for this State.
	Report Incomplete.
ˆ	Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5 Million
7	$5 Million to $50 Million
8	$50 Million to $500 Million
9	$500 Million to $5 Billion.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS:

1/	Flooding continued at the end of the month.
NA	Not available.

FLOOD STAGE DATA:

#	Highest Stage Observed
1/	Continued at end of month
___	Highest Stage of Record
E	Estimated
P	Provisional (Flood Stage)
U	Unknown

RAWINSONDE DATA (Average Monthly Values):

All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon. The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors. These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

*	Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.
+	Observations for these stations are scheduled at 0000 G.C.T.
†	Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

REFERENCE NOTES - Continued

SOLAR RADIATION INTENSITIES: Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

()	Clouds Present	DM	Moderate Dust	HM	Moderate Haze	KS	Slight Smoke
*	Values corresponding to true solar noon	DS	Slight Dust	HS	Slight Haze	M	Moderate Haze-indeterminable
BD	Blowing Dust	F	Fog	I	Intense Haze-indeterminable	N	Sand
BN	Blowing Sand	GF	Ground Fog	K	Smoke	S	Slight Haze-indeterminable
D	Dust	H	Haze	KI	Intense Smoke		
DI	Intense Dust	HI	Intense Haze	KM	Moderate Smoke		

NET RADIATION: The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA: These data are from an U-V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA: The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded $\Omega\ \Omega\ \Omega$) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λ_S designates the type of measurement made.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

APRIL 1975

GENERAL SUMMARY OF WEATHER CONDITIONS

Dr. Richard E. Felch, Climatologist

GHLIGHTS: Rainfall was near normal over much of
e Country with amounts ranging from 0.01 inch at
ownsville, Texas, to 10.18 inches at Baton Rouge,
. Unusually heavy amounts fell in Montana and the
rthern Great Plains. The Helena-Great Falls, Mont.,
ea received over 3 times the expected precipita-
on, much of it as late winter snow. The Gulf
ast, including southern portions of Mississippi,
uisiana, Alabama, Georgia, and northern Florida
s also very wet.

ere were several pockets of extremely dry weather.
e largest areas included southern and west Texas,
w Mexico, and southern Florida.

mperatures during the month averaged well below
rmal across the entire Nation except in the Corpus
risti, Texas area, and southern Florida. Montana
s 10 to 12° below the normal. The northern Great
ains averaged 6 to 8° below normal, due in part to
tended snow cover.

ECIPITATION: The first week of April brought high
nds and wintery conditions to many parts of the
tion. Heavy snow, with thunderstorms immobilized
rts of Illinois and Michigan on the 2d and 3d.
le force winds wracked the North Central and East-
n States on the 3d through the 6th, causing exten-
ve damage and extremely heavy snows across the New
gland region.

avy rains of 2 inches or more fell in northeast
xas and the Gulf Coast during the 2d week. Over 5
ches fell in southern Alabama, Georgia, and north-
n Florida. There was record flooding in many areas, as most of the rain fell within 24 to 36 hours.

Heavy rainfall continued into the following week along the Gulf Coast. Flooding increased on already swollen rivers. At Least 4 tornadoes touched down in northwestern Florida. Rainfall was heavy in parts of the Corn Belt on the 17th-19th. To the south, associated with the same storm system, at least twelve tornadoes were reported, mostly in the mid-section of the Mississippi River Valley.

The last full week of the month brought heavy rains to the southern Corn Belt and parts of Minnesota and Wisconsin.

TEMPERATURE: Except for some warming at the end of the month, most of April averaged well below normal in temperature.

During the first week the entire Nation averaged below normal except for the southern half of Florida. Most of the Nation averaged 6 to 12° below normal with the northern Great Plains and Montana 12 to 21° below. Record lows were established at numerous locations.

Old man winter refused to release his grip during the second week as temperatures continued to average well below normal.

The last full week of April saw considerable warming with much of the Great Plains at least 6° above normal. However, the Western States continued below normal.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

APRIL 1975

Herbert J. Thompson, Office of Hydrology

Record or near record flooding occurred again during April. The areas involved this month were the Grand River Basin in Michigan, where record stages occurred on the Thornapple and Red Cedar Rivers, and in the Choctawhatchee, Yellow, and Escambia River Basins of Alabama and Florida, where flooding was the worst since the record flood of 1929.

Major flooding began in the Souris Basin in North Dakota during April, with crests reached in May, and occurred in the Red River of the North Basin in Minnesota and North Dakota.

The major flooding of March continued into April in the lower Ohio River Basin and southern Atlantic Coast Drainage with streams generally in recession. Significant flooding occurred in portions of the upper Mississippi Basin and major damage occurred in the lower Mississippi Basin.

These and other hydrologic events of unusual significance or involving loss of life or property damage are discussed in more detail below.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	HUDSON BAY DRAINAGE		
Souris River Basin	Major flooding began in the Souris River Basin during April. Near record to record snowfall occurred over the basin the last week of March leaving an accumulation of up to 21 inches as of March 31. Water content of the snow cover was 2 to 3 inches over the U. S. portion of the basin and 1 to 2 inches over the Canadian portion except for the Moose Mountain area, where up to 4.5 inches of water was present. Precipitation during April was several times the normal amount with totals ranging to more than 7 inches. Additional snow accumulated during the period of the 5th-9th followed by a warming trend climaxed by a period of heavy thunderstorm activity on the 25th-28th. The U. S. Portion of the basin received from 1.5 to 2.5 inches of rain in 6-12 hours on the 25th. Additional heavy rain fell on the 27th and 28th with totals for the 4-day period as high as 7 inches and averaging 3 inches. The Canadian portion of the basin received 2 to 3 inches during this period. The combination of heavy rain on the melting snow brought the Souris River over flood stage from Sherwood to Westhope by the end of the month. Crests occurred in May except on the Des Lacs River tributary which rose sharply on the 29th to crest 3 feet over flood stage at Foxholm and fell below flood stage late on the 30th.	0	N.A.
Red River of the North Basin	Serious flooding occurred the latter part of April and into May over the basin. However, crests were in most cases substantially lower than those of 1969, which was the flood of record along the upper Red River and major tributaries. Water content of the winter's accumulation of snow as of the end of March was generally in the range of 1.5 to 2.5 inches except in the Red Lake River Basin where water contents of up to 5 inches were reported.	0	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	HUDSON BAY DRAINAGE-Cont'd		
	Dry soil conditions from the previous fall and a favorable temperature pattern the first two weeks of April permitted much of the snow melt to be absorbed by the ground. However, general rains of more than an inch the middle of the month caused a rapid melt of remaining snow cover and a quick runoff which caused flooding. Heavy rains of 1 to 2 inches the last week of the month augmented the crests along the lower Red River below Oslo. Flooding on tributaries was generally relatively minor. However, crests of 12.4, 7.7, and 6.3 feet over flood stage occurred on the Wild Rice River at Hendrum, the Buffalo River at Dilworth, and the Red Lake River at Crookston, respectively, all in Minnesota. In North Dakota from 3 to 5 feet of flooding occurred along the Goose, upper Maple, and lower Sheyenne and Wild Rice Rivers. On the Red River flooding occurred from above Fargo, N. Dak., downstream into Canada with crests of 11 to 15 feet over flood stage at and above Grand Forks and 4 to 8 feet over flood stage below Grand Forks. Losses were heavy but primarily agricultural since the cities generally had adequate warnings to protect property. Barnes, Cass, and Grand Forks Counties in North Dakota were declared disaster areas.		
	ST. LAWRENCE DRAINAGE		
Lake Michigan Drainage in Michigan	Major, and in some cases, record flooding occurred in the Grand and Kalamazoo River Basins during April. Some damage was also reported along the St. Joseph River but no reporting stations went over flood stage. General rains fell over central Michigan the 18th and 19th with amounts of 3 to 4 inches over the headwaters of the Thornapple River and up to nearly 5 inches over the Red Cedar River Basin. Both are tributaries of the Grand River. On the Thornapple River crest stages at the U. S. Geological Survey station at Hastings and Caledonia were the highest since the record flood of 1947. However, official records at Caledonia began in 1951 and the April crest is the highest since that date. Record flooding occurred on the Red Cedar River at Williamston and East Lansing. The crest of 13.08 feet at Williamston exceeded the previous record of 12.0 feet, which occurred in 1947. At East Lansing, where the major damage occurred, the crest stage of 11.95 feet compares to the previous record of 11.58 feet, which also occurred in 1947. However, the historical flood of 1904 is reported to have reached a stage of 13.4 feet. Flood stage at both locations is 7 feet. By far the greatest damage occurred in East Lansing in Ingham County, where estimates by the Corps of Engineers indicate losses of $25,628,000 to private property and $3,550,000 to public property. An estimated 800 families were evacuated in the East Lansing area	?	34,226

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS-Continued

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ST. LAWRENCE DRAINAGE-Cont'd		
	with up to 100 businesses affected. Thousands of cars were abandoned throughout the area. Three deaths were indirectly related to the flooding when two youths were drowned while rafting on the Grand River at Diamondale and an elderly man was drowned in a flooded roadside ditch. On the Grand River a crest 4.4 feet over flood stage occurred at Lansing while downstream crests just over flood stage were reported at Grand Ledge and Ionia. Up to 300 homes were affected along the Portland-Ionia reach with losses estimated at $254,000. Along the Thornapple River approximately 150 homes and 150 mobile trailers were affected to some degree with losses estimated in excess of $2.2 million. On the Grand River below the mouth of the Thornapple some flooding occurred from Ada down to Comstock Park, where a crest 2.3 feet over flood stage was reported. About 200 homes were affected to some degree along that reach of the river. From 1 to over 2 feet of flooding was reported along the Kalamazoo River with losses in excess of $700,000 in the basin. Losses in excess of $1.2 million were estimated for the Paw Paw and St. Joseph Basins.		
Lakes Huron and St. Clair Drainage in Michigan	The storm of the 18th-19th also caused serious flooding on several streams in east-central Michigan. Rains of up to 5 inches fell over the upper Shiawassee River, about 3 inches over the Flint River Basins, and an average of 3.2 inches over the Clinton River Basin. While there was no snow cover at the time of this rain, streams were high from melting of an early April snowstorm. Most seriously affected was the Flint River Basin with losses estimated at over $7.2 million. Numbers of residents were evacuated in Flint where a crest 4 feet over flood stage occurred. Among the other communities affected were La Peer, Goodrich, and Ortonville. Much of downtown La Peer was flooded. In the Shiawassee Basin a crest 2.2 feet over flood stage occurred at Owasso with the communities of Fenton and Argentine also affected. Losses were in excess of $3 million. One death indirectly related to flooding occurred when a youth drowned near Owasso as his canoe capsized. Flooding on the Flint and Shiawassee Rivers was the worst since the record flood of 1947. Along the Clinton River flood stage was exceeded by 3.5 to 4 feet with estimated losses in the basin in excess of $3 million. Elsewhere losses of more than $3.3 million were incurred in Crawford County in the Sturgeon River Basin and nearly $500,000 along the Belle River and Mill Creek in St. Clair County. There are no reporting stations on these streams.	1	14,182
Maumee River Basin	The heavy rain over southern Michigan, discussed above, caused light flooding on tributaries of the Maumee River draining that area. Crests of 2.3	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS-Continued

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ST. LAWRENCE DRAINAGE-Cont'd		
	and 0.1 feet over flood stage occurred on the St. Josephs River at Montpelier, Ohio, and the Tiffin River at Stryker, Ohio, respectively.		
	ATLANTIC SLOPE DRAINAGE		
Coastal Streams in New England	Widespread urban and small stream flooding resulted from the storm of the 3d-4th, which deposited from 1 to 3.5 inches of rain over the lower elevations of New England. In general this flooding was of a minor nature. However, 60 people were evacuated at Goffstown, N. H., on the Piscataquog River, and the Mad River caused evacuation of 2 families at Waterbury, Conn. Minor lowland flooding occurred along the Connecticut River, which crested 1.2 feet below flood stage at Hartford. The spring snow-melt runoff began about mid-month resulting in lowland flooding again along the Connecticut River, which crested at flood stage at Hartford on the 22d.	0	N.A.
Hudson River Basin	Heavy rains on the 3d over the middle portion of the basin with 12-hour amounts of 1.8 to over 2.5 inches caused widespread small stream and some urban flooding. The Hoosic River crested slightly over flood stage at Eagle Bridge, and Schoharie Creek rose rapidly more than 8 feet to crest just below flood stage at Middleburg and Burtonsville, N. Y.	0	N.A.
James River Basin (Virginia)	Flooding continued early in April on the lower Appomattox River, a tributary of the James, as a result of heavy rains of 1 to 2 inches late in March, cresting about 2 feet over flood stage at Mattoaco on the 1st. A locally heavy shower on the 1st caused a crest one foot over flood stage upstream at Mattoax. These rains fell on wet soil with the stream already high from more serious flooding in March. There was no damage above that caused by the earlier March flooding.	0	G
Coastal Streams in North Carolina	Streams generally continued in recession from the major flooding of March with flooding continuing into April on the Roanoke, Neuse, and Cape Fear Rivers. However, locally heavy rains late in March and early in April caused a second crest above flood stage on the upper reaches of these streams. On the Dan River, a tributary of the Roanoke, a crest 11.5 feet over flood stage occurred at Paces, Va., on the 1st. Otherwise only minor flooding resulted. Kerr Reservoir on the Roanoke River reached a record high level of 318.85 feet, only 1.2 feet below the top of the dam and exceeding the record level of March. Crests on the lower Roanoke occurred late in April due to reservoir releases with flooding into May at Williamston.	0	N.A.
Coastal Streams in South Carolina	These streams also generally continued in recession from the major flooding of March. Locally heavy	0	25

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	rainfall on March 31, April 2-3, and the 14th-15th, caused minor flooding or extended the period of flooding on portions of the Pee Dee, Saluda, and Edisto Rivers. The major crests occurred in March altho a secondary crests 4 feet over flood stage occurred on the Pee Dee River at Pee Dee on the 6th. Estimated losses of $25,000 due to loss of wages were reported on the Pee Dee River.		
Atlantic Coastal Streams in Georgia	Flooding continued from March on the lower Savannah, Ogeechee, and Altamaha Rivers as these streams receded from the major flooding in March. Above normal rainfall occurred over the southern portion of the area. Locally heavy amounts of 2 to 3 inches on the 3d-4th, 10th-11th, and 14th-15th caused a secondary crest on the Ogeechee and on the Savannah River at Millhaven-Wade where a crest nearly 4 feet over flood stage was reported on the 7th. Moderate flooding occurred in the Altamaha Basin with crests 7.5 feet over flood stage on the Ocmulgee at Macon on the 4th, 13.6 feet over flood stage on the Oconee at Milledgeville on the 3d, and 4.3 feet over flood stage on the Altamaha at Charlotte on the 16th. Minor flooding occurred on the Savannah River around Butler Creek and the Satilla River at Waycross. Flooding continued into May on the lower Savannah River at Clyo.	0	N.A.
	EAST GULF OF MEXICO DRAINAGE		
Suwanee and Ochlockonee River Basins	Heavy rains over southwest Georgia and northern Florida of 5-8 inches on the 10th-11th and an additional 1-2 inches on the 14th-15th caused some flooding on these streams. The Ochlockonee crested 5.4 feet over flood stage at Havana, Fla., with mostly timberland affected. Minor flooding occurred along the Withlacoochee River, a tributary of the Suwannee River, which crested just below flood stage at most points but reached flood stage at Ellaville and Branford, Fla. About 50 acres of farmland were inundated in Suwannee County, and damage to park buildings in Gilchrist County was estimated at $1,000. Backwater from the Suwannee River caused flooding along the lower Santa Fe River which crested 3 feet over flood stage at the U. S. Highway 129 bridge.	0	N.A.
Appalachicola River Basin	Heavy rains of up to 8 inches occurred over southwestern Georgia on the 10th-11th, up to 7 inches in northern Florida, and 12 inches in extreme southeastern Alabama on the 9th-10th. The most severe flooding in 27 years was said to have occurred along the Chipola River in Jackson and Calhoun Counties of Florida. Extensive flash flooding occurred along smaller tributaries of the Chipola, and 18 dwellings were flooded at Marianna. Extensive damage was reported at a mining company below Marianna. The Chipola is a tributary of the Appalachicola River from which no stage reports are received. In Calhoun County road damage was estimated at	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS-Continued

APRIL 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	EAST GULF OF MEXICO DRAINAGE-Cont'd		
	$155,000, and 55,000 acres were inundated with no loss estimate available. Light flooding also occurred on the Flint River tributary in Georgia from this storm. Additional rainfall of 2 to 3 inches on the 14th-15th caused more serious flooding along the Flint River with a crest 6.4 feet over flood stage at Albany, Ga., on the 17th. The Chattahoochee River Crested 6.2 feet over flood stage at Wm. F. George Lock & Dam. Downstream, the Appalachicola River continued over flood stage from March with a crest 8.3 feet over flood stage at Blountstown on the 18th.		
Chotowhatchee, Yellow, and Escambia River Basins	Major flooding, the worst in nearly 50 years, occurred over portions of these basins during April. Crest stages on Murder Creek in the Escambia Basin, the Yellow River, and the lower Choctawhatchee River were the highest since the record flood of March 1929 and approximated previously established 100-year flood frequencies. Rains which deluged southern Alabama for 21 hours on the 9th-10th totaled well over 17 inches at a maximum point near Enterprise, Ala., with the 14-inch isohyet encompassing an area approximately 20 miles wide and extending 80 miles in length from near Evergreen to Newton, Ala. Storm totals exceeding 4 inches covered almost all of south-central and southeastern Alabama with the axis of heavy rain oriented east-west across six drainage basins. Rains were conspicuously lighter over northwest Florida varying from one to two inches over most of the Panhandle, although 4 to 6 inch amounts did nose southward into Jackson County, Florida. Flash flooding was widespread over the heavy rain area with numerous roads and bridges washed out or underwater, farmland flooded, and livestock lost. The onset of heaviest rains began during the afternoon of the 9th with a continued rapid development and spreading of numerous thunderstorms northeastward from Mobile into Conecuh, Escambia, and Covington Counties. The thunderstorm area continued to enlarge with a very gradual eastward movement. Heaviest intensities over the area appeared to occur between about 6:00 p.m. on the 9th through 4:30 a.m. on the 10th with rainfall rates appearing to average 2 inches per hour during a four to six hour period. For the entire storm accumulations reflect primarily rains which occurred during the 21 hour period from 1 p.m. on the 9th through 10 a.m. on the 10th. The heaviest flooding involved 10 counties in Alabama and 6 counties in Northwest Florida, with the most serious flooding at communities located along the Choctawhatchee River, lower Pea River, Yellow River, Murder Creek, and Chipola River. Many such communities are highly exposed to flooding since they were originally established and later developed within flood plains. The primary synoptic feature on the 9th and 10th	1	24,384

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)

EAST GULF OF MEXICO DRAINAGE-Cont'd

was a quasi-stationary front parallel to the northern Gulf Coast. The conditions of very moist air at low levels south of the front, conditional instability, and lifting triggered by perturbations along the front, provided the ingredients for strong convective activity and heavy precipitation along and behind the stationary front.

The most serious flooding which resulted from the heavy rains occurred through Conecuh and Escambia Counties along Murder Creek where the communities of Brewton and Castleberry, Ala., are unprotected from flood waters. At Castleberry, which is 15 miles upstream from Brewton, 12 families were forced from their homes and one person drowned when his car was swept into Murder Creek after he ignored a police barricade. At Brewton, where Murder Creek rose to a stage of 19.9 feet, flood waters up to 7 feet in depth rampaged through most of the business and residential area. The creek crested at 5 a.m. on the 11th, with officials terming it a major disaster for the City. Damage figures topped $3.5 million, primarily to the business and industry of the Brewton-East Brewton area. Three out of every 4 businesses in the downtown area sustained heavy damage to stocks and merchandise. Some of the businesses failed to heed the early warnings and consequently had greater losses.

Civil defense officials reported that a major hinderance to flood preparedness was that several respected officials publicly discounted the National Weather Service forecasts in an effort to avoid alarming the public to a situation they believed would not occur, thus, discouraging protective measures which would have likely been taken. Accurate forecasts and warnings were given early and complete dissemination accomplished through the mass news media, civil defense, and other assistance agencies.

By early morning on the 10th, Civil Defense Rescue Teams and National Guard Units were stationed in Brewton, sandbagging and moving property and people above flood height. By the following morning waters were flowing too swiftly to provide assistance even by boat. Flooding forced the evacuation of about 220 families, with 60 homes and 96 businesses severely damaged. Problems were complicated when several large gasoline tanks broke loose and floated through parts of the city spilling raw gas onto the waters. One tank exploded near the city hall destroying a $100,000 city equipment shelter. Brewton was effectively cut off from outside access as surrounding roads throughout the county and into the city were flooded. Serious after effects followed the flood, such as broken sewer lines, pollution and mosquito control, and rebuilding of public streets and roads. For Brewton it was the greatest disaster since the flood of March 15, 1929.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)

EAST GULF OF MEXICO DRAINAGE-Cont'd

Throughout the counties of Geneva, Holmes, and Washington along the Choctawhatchee River 2,000 to 2,500 persons were routed from their homes by flood water. At Geneva, Ala., where flood stage is 23 feet, a crest of 34.4 feet arrived 6:30 p.m. on the 11th. Homes outside the protection of the levee received heavy damage, many of which were almost totally submerged. Approximately 70 homes, 50 mobile homes and 7 businesses were flooded in the immediate area of Geneva. Damage to the city totaled nearly $700,000. Another $1.4 million in agricultural, public, and private damage affected the remainder of the county, with 30 to 40 other homes also flooded along the river. Downstream through Holmes and Washington Counties of northwest Florida and Choctawhatchee River swept southward. In Holmes County 500 families or approximately 1,500 people were evacuated. Nearly $4 million in damage occurred as 215 permanent homes, 282 mobile homes, and 81 businesses were flooded.

At Caryville, Fla., a crest of 18.4 feet occurred at 3:00 a.m., on the 13th. This was 6.4 feet above the 12 foot flood stage and just above the height where numerous homes begin to be affected. In the Caryville-Westville area approximately 1,000 persons were evacuated with flood water reaching a depth from 4 to 6 feet in many homes. Below Caryville, through Washington County, property damage dropped off considerably as the flood-prone area is mostly unpopulated.

Flooding also accompanied a crest moving down the Yellow River into northwest Florida. At Milligan, Fla., where flood stage is 12 feet, the crest arrived at 10 a.m. on the 12th, at 17.71 feet. Fourteen families were evacuated from the lower "Old Milligan" area of the city, which is particularly susceptible to flooding with a few of the homes flooded by 2 to 3 feet of water. Total damage to private property amounted to approximately $86,000. People were prepared for the flood with mobile homes and personal belongings moved above flood height. Other than to agriculture, little damage occurred either above or below Milligan. Several fishing camps were partially exposed to flooding downstream. Heaviest rains which contributed to flooding on the Yellow River fell essentially over the uppermost drainage of the basin.

Dollar estimates of damage during the 9th-11th flood were higher within the agricultural sector than any of the other combined public and private damages. Flooding struck during a very vulnerable period when crops were being planted or cropland prepared for planting. Most fields in southeast Alabama and northwest Florida were freshly plowed and loosely prepared at the time intense rains fell. Many reports were received of top soil being stripped from fields by the excessive runoff, carrying with it valuable fertilizer, chemicals, and seed. Terraces were heavily damaged with field

Basins and Streams | FLOOD EVENT | Lives Lost | Preliminary Estimate of Property Damage (thousands of dollars)

EAST GULF OF MEXICO DRAINAGE-Cont'd

washouts common.

Most counties subjected to flash flooding suffered 60% to 90% crop loss requiring replanting which was delayed by wet fields. Crops primarily affected included corn, peanuts, soybeans, and watermelon. Farm buildings and some machinery suffered damage along the rivers. In 6 counties of Alabama and northwest Florida, flood damage to agriculture alone ranged between $1 and $2 million.

Flood Damages

A breakdown on the 9th-11th flood damage has been compiled from information provided by various cooperative state, private, and federal agencies. This information follows by county:

County	Public Damage	Private Damage	Agricultural Damage
	ALABAMA		
Butler	17,500	0	0
Coffee	180,739	39,135	493,750
Conecuh	222,214	40,000	805,970
Covington	796,700	20,625	1,843,000
Crenshaw	9,000	16,625	295,000
Dale	255,077	44,443	1,755,000
Escambia	205,985	3,494,700	261,750
Geneva	207,280	501,077	1,400,000
Henry	45,000	13,500	177,500
Houston	0	0	2,765,000
Monroe	124,160	0	9,250
TOTALS	$2,063,655	$4,170,105	$9,806,220
	FLORIDA		
Calhoun	168,500	333,000	0
Gulf	71,000	250,000	121,730
Holmes	278,000	1,800,000	1,890,000
Jackson	30,000	155,000	1,500,000
Okaloosa	124,000	86,000	121,300
Walton	60,000	83,000	110,000
Washington	175,000	117,000	870,000
TOTALS	$906,500	$2,824,000	$4,613,030

Total Combined Flood Damage Alabama-Florida -- $24,383,510

Alabama-Tombigbee River Basins	Rains of 2-4 inches fell over the headwater tributaries of the Alabama River on the 2d-3d. Minor flooding occurred on the Oostanaula River. About 4 feet of flooding occurred on the lower Tallapoosa. On the Alabama River crests near flood stage occurred from Montgomery down to Selma, Ala. From 3 to 5 feet of flooding occurred on the lower Alabama. The Tombigbee was in recession from the serious flooding of March and was over flood stage during	0	660

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS-Continued

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	EAST GULF OF MEXICO DRAINAGE-Cont'd		
	the first week or two of April. Rains of 3 inches or more on the 14th-15th caused 3 to 5 feet of flooding on both the lower Alabama and extreme lower Tombigbee aided by the high water from the previous flooding. Losses estimated by the Corps of Engineers were primarily agricultural.		
Pearl River Basin	Monthly rainfall totals ranged from 4 to over 13 inches with Bogalusa, La., reporting 13.59 inches for the month. Most of this rain occurred during the week ending on the 15th with amounts of 2 to over 6 inches during that period. Bogalusa received over 5 inches during a 24-hour period the 14-15th which caused urban and small stream flooding from Coburn and Bogue Lusa Creeks. The Pearl River was in recession from the March flooding at the beginning of the month but continued over flood stage at and below Jackson, Miss., except at Columbia, during the early part of the month and until the 29th at Bogalusa. The storm of the 14-15th caused minor flooding at Carthage, 5 to 8 feet of flooding along the Monticello to Jackson reach, a secondary crest 4 feet over flood stage at Bogalusa and a crest 2.7 feet over flood stage at Pearl River, La.	0	N.A.
	UPPER MISSISSIPPI BASIN		
Mississippi River tributaries in Minnesota and Wisconsin	Precipitation was above to much above normal over all but the extreme north-central portions where it was slightly below normal. Departures were around 1 inch above in the east to 3.5 inches in the central. Rain fell on most days from the 13th on but especially the 22d-23d and the 26th-27th. At Minneapolis-St. Paul, the April rainfall of 5.40 inches was the heaviest April precipitation of record. The previous was 5.12 in 1896. The first storm, on the 22d-23d, produced one inch or more from southwestern Minnesota through north-central Wisconsin. A narrow band of 2 inches or more was recorded from near New Ulm, Minn., to Turtle Lake, Wis. The second and stronger storm, on the 26th-27th, yielded one inch or more over all but the northwest portion of the district. Four to as much as 5.5 inches was recorded in an area bounded by Soldier's Grove to Jim Falls, Wis., to near Red Wing, Minn. Streams were already high due to snowmelt and rainfall in early April. In Minnesota, flooding began as early as the 21st on the lower Minnesota River while flooding began in Wisconsin a few days later. In general the more significant flooding extended into May with crests also in May. However, crests of 1 to 3 feet over flood stage occurred late in April on the Trempealeau River at Dodge, Wis., the Root River at Hokah, Minn., the Black River at Galesville, Wis., the Chippewa River at Durand, Wis., and the lower Kickapoo River at Steuben, Wis. Minor flood crests occurred the end of the month on the St. Croix River at Stillwater, Minn., the middle reach of the Kickapoo River, and the Wisconsin River	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS-Continued

APRIL 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	UPPER MISSISSIPPI BASIN-Cont'd		
	at Portage, Wis.		
Rock River Basin	At the beginning of the month streams in the Rock Basin were in recession from the record flooding of March with the Rock River and lower Pecatonica above flood stage. Flooding ended by the 10th except for the Rock River at Afton, Wis., which continued over flood stage the entire month. Rains of 3 to 5 inches on the 27th-28th caused sharp rises on streams which crested just below flood stage except on the upper Pecatonica and the Kishwaukee River which reached or slightly exceeded flood stage.	0	N.A.
Mississippi River Tributaries in Iowa	There was no serious flooding in this area during April. Flooding continued from March on the Wapsipinicon River ending on the 3d. Rapid snowmelt caused several crests of 1 to 2 feet over flood stage on Blackhawk Creek and the upper Iowa River early in the month. Rains of 2 to 3 inches occurred the night of the 27th over the upper portions of the Des Moines, Iowa, Cedar, and the Raccoon River Basins. Crests were generally in the range of 1 to 3 feet over flood stage on the Winnebago and Shell Rock Rivers, the upper Iowa River, the Raccoon River Basin, and the upper Des Moines River. A crest 3.6 feet over flood stage was reported on the Des Moines River at Stratford. Bankfull stages to minor flooding was reported on portions of the South Skunk and Cedar Rivers. Flooding continued into May on a few streams.	0	N.A.
Illinois River (Illinois)	The heavy rains of late March caused flooding at Beardstown which continued into April cresting 1.2 feet over flood stage on the 5th. Minor flooding began at Meredosia on the 2d and at Havana on the 3d from this storm. Heavy rains of up to nearly 4 inches on the 18th-19th caused urban flooding in Chicago and flooding along the upper Illinois with crests about 2.5 feet over flood stage at Morris and LaSalle. Two periods of general rains of up to 2 inches on the 24th-25th and the 27th-29th caused a resumption of flooding with crests about 4 feet over flood stage at Morris and LaSalle. Flooding continued into May at and below LaSalle with downstream crests in May.	0	N.A.
Mississippi River Tributaries in Missouri	Flooding from the late March rains crested slightly over flood stage on the Meramec River at Pacific and Valley Park on March 31. Flooding began on the Cuivre River at Old Monroe on the 1st with a crest 6 feet over flood stage on the 10th resulting from the storm of the 8-9th. The storm of the 23-25th caused flooding along the Salt River, with a crest 7.6 feet over flood stage at New London, and in the Meramec River Basin. Crests of about 3 to 6 feet over flood stage occurred on the Bourbeuse River, the lower Big River, and the Meramec River below Sullivan.	0	N.A.
Upper Mississippi Main Stem	Snowmelt began during the last half of the month over the headwaters in northern Minnesota which,		2,700

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS-Continued

APRIL 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	UPPER MISSISSIPPI BASIN-Cont'd		
	combined with the heavy runoff from southern Minnesota and Wisconsin (discussed above) produced flooding from Libby in northern Minnesota down to Dubuque, Iowa, by the end of the month. This flooding continued into May with crests in May. Downstream, the Mississippi continued over flood stage from Hannibal, Mo., to Alton, Ill., receding from the flood crests of late March and ending by the 4th. Flooding also continued from the late March rainfall along the reach from Chester, Ill., to the mouth of the Ohio with crests of 1 to about 3 feet over flood stage early in April. Heavy runoff from Illinois and eastern Missouri due to the storm of the 24th-25th caused the Mississippi to return to flood conditions at and below Louisiana, Mo., except in the vicinity of St. Louis. Crests ranging from about 2 to 4.3 feet over flood stage occurred by the end of the month along this reach with flooding continuing into May at and below Grafton, Ill., except around St. Louis.		
	MISSOURI BASIN		
Missouri River Basin in North Dakota	Snow cover of more than 20 inches existed over the Knife, Heart, and Cannonball River Basins as of April 1. This was augmented by general precipitation of more than one inch over the area on the 7th-10th. A long period of warmer temperatures followed this storm with strong rises on all streams. Lowland flooding occurred along the Knife River with a crest 2.4 feet over flood stage at Hazen. Overflows were reported along Square Butte and Spring Creeks. Most seriously affected was the town of Beulah near the junction of Spring Creek and the Knife River where damage of $30,000 was reported to city property, mostly sewers. More than 200 people were evacuated from their homes in Beulah, and Highway 49 was closed there. About $10,000 worth of hay was lost at the Keogh Ranch south of Beulah. Several county bridges were washed out and an elderly man drowned when his car slid off a flooded county road. Minor flooding was reported along the Heart and James Rivers. The Missouri River crested 1.4 feet over flood stage at Washburn from the heavy inflow of the Knife River. Heavy rains totaling 2-3 inches on the 26th-29th again brought the Knife River over flood stage with a crest 1.6 feet over flood stage at Hazen on May 1.	1	N.A.
Missouri Basin in South Dakota	On the 30th heavy rain between the Bad and Cheyenne Rivers caused local lowland flooding. Unofficial reports indicated 5 inches of rain 20 miles northwest of Philip. No reporting stations went over flood stage.	0	N.A.
Little Sioux River (Iowa)	Moderate flooding occurred along the Little Sioux River late in April as a result of several periods	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS-Continued

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	MISSOURI BASIN-Cont'd		
	of rain during the month. On the 8th-9th rains of 0.5 to 1.0 inch combined with melting of snow in low lying areas to cause a rise to near flood stage at Spencer. On the 23d an average of 1.5 inches fell over the basin. On the 26th-27th amounts of 1.5 to 3.2 inches occurred. Flooding began at Spencer on the 23d and by the end of the month had extended down to Oto. Crests along the river above Correctionville ranged from 3.5 to 6 feet over flood stage with less flooding at and below Correctionville. Flooding continued into May along this entire reach. Damage was reported to roads, bridges, and culverts.		
Kansas River Basin	Several periods of heavy rain during April caused strong rises on a number of streams. Amounts of 0.75 to 1.0 inch on the 8th-9th followed by amounts of 1 to 2 inches on the 17th caused a crest near flood stage on the Vermillion River with many smaller streams at bankfull level. No flooding was reported. On the 23d-24th isolated amounts of up to 1.85 inches caused urban flooding in Assaria and inundated State Highway 40 near Elmo, Kansas. Amounts of 1.5 to 2.7 inches over the Stranger Creek Basin caused crests near flood stage at Easton and Tonganoxie with minor overflow.	0	N.A.
Lower Missouri Basin	Total rainfall for April was quite variable over southeastern Iowa and west central and northwest Missouri ranging from less than 2 inches at several stations to more than 8 inches in the Kansas City area. Average over the area was about 4 inches. Aside from locally heavy rain over the lower Grand River on the 18th-19th which caused a crest slightly over flood stage at Sumner, Mo., and over the lower Nishnabotna River on the 28th-29th which caused a crest 3.6 feet over flood stage at Hamburg, Iowa, most of the rain occurred on the 23d to 24th. This storm deposited amounts of about 3 to over 4 inches in a band more than 50 miles wide from Leavenworth County in Kansas to Chariton County in Missouri. The heaviest concentration was in Platte and Clay Counties, Missouri, just north of Kansas City. Flash flooding was general on small streams in these counties with numbers of cars abandoned at small stream crossings. One woman was drowned when she left her car and was carried downstream by Rush Creek. The Little Platte River Crested 10 feet over flood stage at Smithville, Mo., which put 4 feet of water on some streets in the town. About 150 people were evacuated from their homes in Smithville, but damage was relatively light as the flood waters receded quickly due to the local nature of the storm. Urban flooding was reported in several areas of northern Kansas City. Elsewhere in the area flooding occurred on the lower Grand River with a crest 6 feet over flood stage at Sumner, Mo. Up to about 4 feet of flooding occurred on the lower Chariton River, and as much as 7 to 8 feet of flooding on the Lamine and Blackwater Rivers. The heavy tributary inflow	1	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS-Continued

APRIL 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	MISSOURI BASIN-Cont'd		
	caused 1 to 2 feet of flooding on the Missouri River from above Boonville to below Jefferson City. While flooding of farmland was quite extensive along these streams, damage was light since crops had not been planted.		
	OHIO BASIN		
Monongahela River Basin	Above normal rainfall occurred during April over this basin with totals of 5 to 6 inches common. There were only 9 days without some precipitation. However, amounts were generally light except for the 24th-26th when up to more than 2 inches occurred. Light flooding resulted on the lower Monongahela with crests up to 2.5 feet over flood stage. The Youghiogheny River reached flood stage at Connellsville, Pa. Some street flooding occurred in towns along the lower Monongahela and the parking wharf in Pittsburgh was flooded.	0	N.A.
Middle Ohio River Basin	Rainfall ranged from 60 percent of normal over the upper Scioto Basin in Ohio to well above normal over central West Virginia. The major storm occurred on the 23d-25th with amounts generally in the range of 2 to 4 inches. This produced strong rises on many streams in the area with the Scioto River cresting within a foot of flood stage at Piketon, Ohio. A rise of more than 20 feet occurred at some points on the Ohio River. No stream flooding occurred but urban flooding was reported at Loveland on the Little Miami River in Ohio.	0	N.A.
Ohio River Tributaries in Kentucky	Flooding continued into early April from the heavy rainfall of late March on the lower Kentucky, Green, and Salt Rivers and the Cumberland River at Williamsburg. Damage estimates were included in the March report. Crests on the lower Green River occurred in early April and were in the range of 6 to 8.5 feet over flood stage. Rains of 4-7 inches on the 24th-25th caused severe flash flooding in parts of north central and eastern Kentucky. The main street of Neon was flooded by 3 to 5 feet of water. Crests on the lower Green ranged up to 5 feet over flood stage while 1 to 2 feet of flooding occurred on the Licking River. Thousands of acres of bottomland were again inundated along the lower Licking, Salt, and Green Rivers. Damage from the late April flooding is not available.	0	N.A.
Wabash River Basin	Flooding from the heavy rains of late March continued into April on the Little Wabash and the lower Embarras, White, and Wabash Rivers. Crests occurred early in April and were generally in the range of 4 to 6 feet over flood stage on the lower Embarras, White, and upper Little Wabash Rivers and 1 to 3 feet over flood stage on the lower Wabash River. A crest 8.4 feet over flood stage occurred on the lower Little Wabash at Carmi, Ill. Damage estimates for this period of flooding were included in last month's report. The storm of the 24th-25th deposited rainfall amounts ranging from over an inch	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS-Continued

APRIL 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	OHIO BASIN-Cont'd		
	in the headwaters to more than 5 inches over the lower portion of the basin. Flooding occurred on the Skillet Fork, Little Wabash, and the lower Embarras, White, and Wabash Rivers. Crest stages were generally within a foot or two of these which occurred earlier in the month. A crest 10.6 feet over flood stage occurred at Carmi, Ill., on the Little Wabash. The extensive flooding of low lying farmland, which extended into May, delayed cultivation of fields.		
Tennessee River Basin	The major flooding of March continued into April on the Middle Tennessee River at Decator and Florence, Alabama, ending by the 9th. The heavy rains of late March prolonged this flooding and caused an additional period of flooding downstream at Savannah, Tenn., with a crest 2.6 feet over flood stage on the 2d. The late March storm also caused a crest 5 feet over flood stage on South Chickamauga Creek near Chattanooga.	0	N.A.
Ohio River Main Stem	The major flooding which began in March continued into April. The Ohio was above flood stage from McAlpine Dam downstream to the mouth at Cairo, Ill. The amount of flooding on the lower Ohio was generally in the range of 8 to 12 feet but ranged up to the crest of 18.5 feet over flood stage reported at Ford's Ferry, Ky. The crest stage of 56.47 feet at Cairo was the second highest of record, exceeding the April 1973 crest by nearly a foot. Flood stage at Cairo is 40 feet. Flooding ended by the 15th but heavy inflow from the storm of the 24th-25th brought moderate flooding to many points on the lower Ohio from Tell City, Ind., downstream. Crests were substantially lower than those of early April and were in the range of 3-8 feet over flood stage. Flooding continued into May.	0	N.A.
	WHITE BASIN		
Black, White, and Cache Rivers	Major flooding continued into April on these streams. The Cache River crested 3.3 feet over flood stage on the 2d at Patterson, Ark., where flooding continued the entire month. Crests of 7 to 9 feet over flood stage occurred along the White River below Newport, Ark., with flooding continuing into May at Augusta, Clarendon, and St. Charles. The lower Black River receded to below flood stage by the 18th, but rains of up to 2 inches the 24-25th and 29-30th brought the lower Black River back over flood stage at Black Rock with flooding into May. These rains also prolonged the flooding on the Cache and White Rivers.	0	N.A.
	ARKANSAS BASIN		
Arkansas Basin	There was no new flooding in the basin during April. Flooding from the heavy rains of late March continued during the first week of April on the Deep Fork	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS-Continued

APRIL 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ARKANSAS BASIN-Cont'd		
	River at Beggs, Okla., the Fourche La Fave River at Houston, Ark., and the Arkansas River at Van Buren, Ark., where a secondary crest 1.8 feet over flood stage occurred on the 3d. Except for the Cottonwood Basin in Kansas, precipitation was generally well below normal with crops suffering damage from lack of moisture in some areas.		
	RED BASIN		
Sulphur River	Flooding from upstream rains in late March caused a few days of minor flooding at Naples, Tex., early in April. Rains during the second week of April averaged about 1.5 inches with 2 to 3 inches over the headwater on the 7th-8th, which caused 2 to 3 feet of flooding along the Sulphur River, affecting mostly grazing lands.	0	N.A.
Ouachita, Black, and lower Red Rivers	Flooding continued from March on the Ouachita River from above Camden, Ark., to below Monroe, La., and on the Black River. Flooding lasted the entire month of April at Monroe and along the Black River aided by rains of 5 to 7 inches during the month. The Ouachita crested about 5 feet over flood stage at Camden on the 2d. A broad flat crest, 2.2 feet over flood stage, occurred at Monroe the middle of the month and a period of minor flooding at Columbia Lock also occurred the middle of the month. A flat crest about 5 feet over flood stage also occurred along the Black River the middle of April. The lower Red River below Alexandria, La., was in flood the entire month due to the heavy inflow from the Black River and backwater from the Mississippi. There are no reporting stations along the lower Red. Losses were estimated by the Corps of Engineers and include $2,206,000 of crop damage with over 670,000 acres inundated. Only about 100 head of cattle were drowned but more than 13,000 were evacuated at a cost of $600,000. More than 400 families were displaced from their homes.	0	52,000
	LOWER MISSISSIPPI BASIN		
Hatchie and St. Francis Rivers	Minor flooding from the late March rains continued into April on the Hatchie River in Tennessee with a crest one foot over flood stage at Bolivar on the 2d. No reports were received downstream. The major flooding on the St. Francis River in Arkansas continued into April at St. Francis receding below flood stage there by the 16th. Downstream at Madison flooding began on the 4th with a crest 2.5 feet over flood stage on the 7th. Rains of up to 2 inches in amount on the 24th-25th and 29th-30th caused renewed flooding at St. Francis which continued into May further delaying farm operations.	0	N.A.
Yazoo, Big Black Rivers	The major flooding which began the middle of March continued into April. Rains totaling 4 to 6 inches occurred during the second week of the month extend-	0	G

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	LOWER MISSISSIPPI BASIN-Cont'd		
	ing the duration of flooding in the Yazoo Basin and causing another period of less serious flooding on the Big Black River. The Tallahatchie dropped below flood stage at Swan Lake, Miss., on the 25th. Downstream on the Yazoo River the major crest of nearly 5 feet over flood stage occurred at Yazoo City, Miss., on the 14th with flooding continuing into May. On the lower Yazoo flooding was aggravated by backwater from the Mississippi. Farming and lumbering operations were at a standstill thru April and hundreds of people evacuated in March continued to be housed in emergency quarters during April.		
Lower Mississippi Main Stem	Flooding which began in March, due mainly to the heavy inflow from the Ohio River, crested during April along the lower Mississippi. Peak stages ranged from about 10 feet over flood stage at New Madrid and Caruthersville, Mo., down to one foot over flood stage at New Orleans. There was no flooding at Arkansas City, Ark. The flood gates at Bonnet Carre spillway were opened during the period of the 14th-27th diverting about 2 million acre-feet of water to Lake Pontchartrain and taking about 2 feet off the crest at New Orleans. Diversions were also made upstream into the Atchafalaya River Basin. Near the end of the month a flood crest from the upper Mississippi caused flooding at New Madrid and Caruthersville which continued into May. Flooding also continued into May at Red River Landing and Baton Rouge, La., but ended late in April downstream due to the above mentioned diversions.	0	44,000
	WEST GULF OF MEXICO DRAINAGE		
Atchafalaya River	Flooding began early in the month along the upper river around Simmesport, La., and crested the middle of April as a result of diversions from the Mississippi River. On the lower river flooding which began at Morgan City, La., in February continued the entire month with a crest nearly 4 feet over flood stage on the 22d. Damage was confined to riverside structures and recreational facilities since cities involved are protected by levees. However, these losses were considerable.	0	N.A.
Calcasieu River	Rainfall over the basin ranged from 5 to 8 inches during April with several periods of heavy rain. The first of these periods on the 8th-10th caused the river to go over flood stage. The crest, 2.3 feet over flood stage on the 15th, followed another rainy period on the 13th-15th. A third period of rainfall on the 19th-21st caused a minor secondary crest on the 22d and prolonged the period of flooding.	0	N.A.
Eastern Texas Streams	Minor to moderate flooding occurred along the Sabine, Trinity, and lower Guadalupe Rivers and in the lower Neches River Basin as a result of two periods of heavy rainfall during April. Amounts of up to 3	0	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	WEST GULF OF MEXICO DRAINAGE-Cont'd		
	inches fell on the 7th-9th and 14th-15th. The most significant flooding was along the Trinity River from Crandall to Long Lake with crests of 2 to 9 feet over flood stage. From 1 to over 3 feet of flooding occurred on the lower Trinity from Liberty to Moss Bluff which was caused in part by releases from Lake Livingston. Some flooding occurred along the Sabine River from Emory down to Longview. Crests were in the range of 1 to 3.5 feet over flood stage. In the lower Neches River Basin crests of 1.3 feet over flood stage occurred on Village Creek at Kountze and Pine Island Bayou at Sour Lake. These are smaller tributaries of the Neches northwest of Beaumont. On the lower Guadalupe two brief periods of flooding occurred at Dupont with crests 0.4 and 2.3 feet over flood stage.		

Note:

NO DATA RECEIVED

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code [illegible] defined in the August 1963 WMO [illegible], entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

[illegible] Milli-atm-cm

Station	Day of month																														
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

REFERENCE NOTES

[illegible] – [illegible] data in the table apply to the period 24 hours prior to time of observation. [illegible] see individual Climatological Data for times of observation.

+ And also on an earlier date or dates.
D Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch of water equivalent to every 10 inches of snowfall

CLIMATOLOGICAL DATA - METRIC UNITS: Data from airport unless otherwise specified.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
U Indicates Urban site.
R Indicates Rural site.
[illegible] Station pressures apply to elevations shown in the Elevation Table of the annual issue of this publication.

Conversion formulae to English Units are as follows:

1 foot = 0.3048 meters
F. = $\frac{9}{5}$ x C. + 32
1 inch = 25.4 millimeters
1 mile per hour = 0.447 meters per second

HEATING DEGREE DAYS: Data from airport unless otherwise specified.

U Indicates Urban site.
R Indicates Rural site.

COOLING DEGREE DAYS: Data from airport unless otherwise specified.

U Indicates Urban site.
R Indicates Rural site.

STORM SUMMARY:

° Includes crop damage.
[illegible] Crop damage.
* No occurrence of storms or unusual weather phenomena reported.
[illegible] Includes heavy sleet storm
# Freezing drizzle and freezing rain, commonly known as glaze.
Ø For breakdown of "All Others," and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
[illegible] No Storm Data Report received for this State
[illegible] Report Incomplete
† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5 Million
7 $5 Million to $50 Million
8 $50 Million to $500 Million
9 $500 Million to $5 Billion.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS:

1/ Flooding continued at the end of the month.
NA Not available.

FLOOD STAGE DATA:

# Highest Stage Observed
1/ Continued at end of month
___ Highest Stage of Record
E Estimated
P Provisional (Flood Stage)
U Unknown

RAWINSONDE DATA (Average Monthly Values):

All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon. The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors. These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.
~ Observations for these stations are scheduled at 0000 G.C.T.
† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

REFERENCE NOTES (Continued)

SOLAR RADIATION INTENSITIES: Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

()	Clouds Present	DM	Moderate Dust	HM	Moderate Haze	KS	Slight Smoke
*	Values corresponding to true solar noon	DS	Slight Dust	HS	Slight Haze	M	Moderate Haze-indeterminable
BD	Blowing Dust	F	Fog	I	Intense Haze-indeterminable		
BN	Blowing Sand	GF	Ground Fog	K	Smoke	N	Haze
D	Dust	H	Haze	KI	Intense Smoke	S	Slight Haze-indeterminable
DI	Intense Dust	HI	Intense Haze	KM	Moderate Smoke		

NET RADIATION: The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA: These data are from an U-V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA: The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded $\Omega\ \Omega\ \Omega$) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

MAY 1975

GENERAL SUMMARY OF WEATHER CONDITIONS

Dr. Richard E. Felch, Climatologist

LIGHTS: Precipitation totals ranged from noth-
in parts of the Southwest to over 12 inches in
s of Oklahoma, Texas, and the Carolinas. Amounts
well above normal in the Atlantic Coastal States,
Southeast and Deep South, Texas, the southern
t Plains, and the northern Rocky Mountains. The
notable dry areas were New England, the north
ral Great Plains, New Mexico, California, and
on.

of the Rockies, the Nation averaged warmer than
l with the greatest departures occurring in some
h Central States and New England.

IPITATION: May began with heavy rain and some
ent weather in the Southeast and Texas. Locally
y rains in Louisiana, Arkansas, Tennessee, and
heast Texas produced local flooding.

heaviest precipitation during the week ending
11th occured in Montana, central Texas, and the
r Mississippi River States. Severe weather oc-
ed from the Central Plains to Georgia with num-
s tornadoes reported. Three twisters struck
a, Nebr., simultaneously on the 6th resulting
he worst tornado disaster there since Easter
ay, 1913. An even more intense twister nearly
royed the town of Magnet in northeast Nebraska.
adoes struck Mississippi, Louisiana, Arkansas,
western Texas on the 9th.

irly open week from the 12th to the 18th in the
h Central States gave Corn Belt farmers a good
t in planting. Heavy rain fell in western
aska and northeast Colorado southeastward to
siana and east and north to New Jersey.

y snow fell in the Rockies during the following
. Lander, Wyo., accumulated 18 inches on the
nd despite some melting. Severe weather also
rred from Texas to the Northern Plains. The
mid-South and Southeast got a welcome respite from heavy rains. Twenty-one tornadoes were reported in Texas, Arkansas, Iowa, Illinois, Minnesota, and Michigan on the 19th.

Heavy rains of 2 inches or more fell in many parts of the Nation west of the Rockies during the final week of May. Over five inches of snow fell on the 29th at Denver, Colo., the heaviest ever reported so late in the season.

TEMPERATURE: Record breaking low temperatures occurred in Colorado, Michigan, and New England during the first few days of May. Freezing temperatures occurred again in the northern Rockies on the morning of the 5th.

Temperatures during the week ending on the 11th averaged well below normal from the Rockies westward, and in the Atlantic Coast States. Warm temperatures in the Corn Belt and Great Plains gave farmers a big boost in spring planting.

Most of the Nation was warmer than usual the week ending on the 18th. Only the Southern Great Plains, parts of the Corn Belt, and the central Alpalachians were colder than normal. On the 13th, Bakersfield, Cal., reached 106°, a record for so early in the season.

Sharp contrasts in temperatures set record highs and lows almost daily during the week ending on the 25th. Temperatures in the eastern half of the Country averaged as much as 18° above normal while Wyoming, under a heavy snow cover, averaged at least 12° below normal.

The last week of the month averaged well below normal in the central portions of the Nation and above in the West and East.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MAY 1975

Herbert J. Thompson, Office of Hydrology

Major flooding continued from April in the Souris Basin of North Dakota, portions of the Upper Mississippi Basin, and the lower Red River Basin in Louisiana. Significant flooding also continued in the Red River of the North Basin, the lower Ohio Basin, and the White Basin in Arkansas.

A record flood occurred on the upper Calcasieu River in Louisiana and significant flooding occurred in several areas of the country, including the Atlantic Slope Drainage in the Southeast, the Pearl River Basin in Mississippi, and the West Gulf Drainage in Texas.

The spring breakup occurred in Alaska with serious flooding from ice jams on several streams. Minor snowmelt flooding occurred on the St. John River in Maine, the headwaters of the Missouri and Yellowstone Rivers, the Great Basin, and the headwaters of the Columbia River.

A number of flash or urban flooding events occurred during May, the most serious of which were at Charlotte, N. C., and the headwaters of the Big Sandy River in Kentucky and Virginia resulting in damages of several million dollars.

These and other hydrologic events of unusual significance or involving loss of life or property damage are discussed in more detail below.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	HUDSON BAY DRAINAGE		
Souris River (North Dakota)	The major flooding which began in April crested in May with new record stages at several points. About an inch of rain occurred over the basin on the 6th-8th in addition to the heavy rains of late April which were the primary cause of the record flooding. The crest at Lake Darling of 23.77 feet exceeded the old record set in 1943 by almost one foot. The record stage was caused by increased storage in the lake to lower the crest at Minot downstream. Below Minot the crest stages at Logan, Sawyer, and Velva all exceeded the previous record stages of 1969 by amounts of 0.04 to 0.22 foot. Crests were generally from 5 to 6 feet over flood stage from Minot upstream and 2 to 3 feet over flood stage below Minot except at Westhope where the crest was 6.5 feet over flood stage. Total damage estimates are not available for the basin. Damage in Minot was relatively light, estimated at $800,000 to streets and storm and sanitary sewers and $77,000 to parks. About $2 million was spent on additional flood control structures which together with those constructed in 1969 resulted in savings estimated at $26.9 million by the Corps of Engineers. More than 3,100 people were evacuated from flood prone areas of Minot as a precautionary measure in case the dikes should fail which did not happen. Flooding was severe in rural areas with numbers of farm homes affected and hundreds of thousands of acres of farmland inundated. The reach from Velva to below Bantry was particularly affected with first floor flooding of homes common in McHenry County where 45 farm families were evacuated. In Bottineau County 167,000 acres were flooded. Flooding continued into June along the Souris River below Lake Darling. Two men were drowned while driving cattle through the flood waters.	2	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MAY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	HUDSON BAY DRAINAGE-Cont'd		
Red River of the North Basin	Flooding continued from April in the Red River Basin. All tributaries of the Red were in recession at the beginning of the month and had fallen below flood stage by the 6th. The Red River crested in April at and above Oslo, Minn., and crested early in May at downstream points falling below flood stage by the 17th. Damage estimates are not available but losses were primarily agricultural since most communities are protected by dikes and levees. The Corps of Engineers estimated savings of $4.8 million thru operation of flood control structures in conjunction with flood forecasts and warnings.	0	N.A.
	ST. LAWRENCE DRAINAGE		
Great Lakes Tributaries	Minor flooding occurred along several streams draining into the Great Lakes. Melting of a heavy snowpack in northern Wisconsin augmented by more than an inch of rain brought the Wolf River over flood stage on April 28 with a crest 0.3 foot over flood stage at New London on April 30. Flooding continued until May 10. No damage was reported. In the Maumee Basin of Indiana and Ohio the St. Josephs and Tiffin Rivers were over flood stage from the 7th to the 10th at Montpelier and Stryker, Ohio, respectively, with no damage reported. Locally heavy thunderstorms caused some urban flooding in Detroit, Mich., on the 25th and 30th. The Cuyahoga River crested 1.9 feet over flood stage on the 22d at Independence, Ohio, as a result of locally heavy thunderstorms upstream. There was considerable lowland flooding along the Cuyahoga with some agricultural damage. A covered bridge over Furnace Run was destroyed by debris. Further east, flash flooding was reported at Arcade, N. Y., along Cattaraugus Creek in the Lake Erie drainage. The stream rose 5.5 feet in two hours during the evening of the 23d. Four trailers suffered some damage. Urban flooding occurred in Buffalo and Amherst, N. Y., on the 21st, in East Aurora on the 22d, and in Syracuse on the 23d.	0	N.A.
	ATLANTIC SLOPE DRAINAGE		
St. John River (Maine)	The spring snowmelt runoff brought the St. John River over flood stage at Fort Kent, Maine, about the 7th. A crest of 1.5 feet over flood stage occurred on the 14th with some lowland and basement flooding reported. The crest was probably caused by locally heavy showers over various areas of Maine during the evening of the 13th which caused urban flooding in several towns. Street	0	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	damage of $11,000 was reported at Worthington, thought to have been caused by breaking of a beaver dam.		
Connecticut River Basin	Flash flooding caused serious damage along the South Branch of the Williams River, a tributary of the upper Connecticut River in Vermont. This flooding resulted from a heavy rainstorm centered over Chester, Vt., which deposited 5.5 inches of rain in 75 minutes over that city on the evening of the 31st. A bridge was destroyed along Rt. 103 near Chester and highway damage was also reported.	0	200
Susquehanna River Basin	Flooding occurred on the Chemung River at Chemung, N. Y., on the 7th with a crest 1.3 feet over flood stage. Rains of 1 to 2 inches on the 1st-2d were followed by rains of up to 2 inches on the 4th-7th which caused the flooding. Although damage was light this was the highest stage reached at that point since the Hurricane Agnes flood of 1972. These rains also caused urban flooding in Binghamton, N. Y., where the Susquehanna River rose to within a foot of flood stage and small stream flooding in the Unadilla area.	0	N.A.
Roanoke, Cape Fear and Pee Dee River Basins	Flooding continued until the 6th on the lower Roanoke River due to releases from John H. Kerr Reservoir made necessary by the heavy April rainfall over the upper basin. Locally heavy rains on the 15th-16th and 18th with amounts of 1 to more than 2 inches caused some minor flooding on the Cape Fear River at Elizabethtown, N. C., and a ten-day period of flooding on the Lumber River with a crest 1.7 feet over flood stage at Lumberton, N. C. On the Pee Dee River rains of 1.5 to 4 inches occurred over the upper portion of the basin on the 3d-4th. A strong rise of 14 feet within 24 hours occurred at Cheraw, S. C., which crested below flood stage there. Minor flooding resulted at Pee Dee S. C., from this rain. The rains during the middle of the month caused some flooding along the Pee Dee from Cheraw to Pee Dee with crests 0.7 to 1.7 feet over flood stage. Losses of $15,000 were reported in the Pee Dee Basin.	0	N.A.
Santee River Basin	Severe flash flooding struck northwest Charlotte, N. C., early on the 30th. Rainfall reports in the area for the 24 hours ending at 8 a.m. on the 30th ranged from less than an inch to 6.1 inches at McAdenville, N. C. Urban and small stream flooding was widespread in Gaston, Mecklenberg, Cabarrus and Stanley Counties. Most of the damage was in northwest Charlotte where 62 houses, 14 mobile homes, and 21 businesses were affected. Residential damage was estimated at $156,000 and commercial losses at $2,695,000. The South Fork of the Catawba River crested 2.2 feet over flood stage at McAdenville from this storm.	1	2,866

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	In the Broad River Basin 2 to 4 inches on the 1st-4th caused flooding on the lower Broad River Basin with a crest nearly 6 feet over flood stage at Blair, S. C., on the 4th. Locally heavy rain of up to over 3 inches on the 15th-16th caused minor flooding at Blair on the 17th. Heavy rain occurred the 17-18th over the headwaters of the Broad with an unofficial report of 6.4 inches near Lake Lure, N. C. Minor flooding resulted downstream at Gaffney and Blair. Damage of $15,000 was reported below Lake Lure to crops and roads. Over 10,000 tomato plants were destroyed. The storm of the 30th, discussed above, deposited 2.5 to 4 inches over the headwaters of the Broad River causing flooding downstream with crests of 2.2 feet and 6.1 feet over flood stage at Gaffney and Blair, S. C., respectively. Rainfall of more than 3 inches fell over the Catawba River above Lake Wylie on the 3d. The resulting discharge from Lake Wylie caused Wateree Reservoir to crest one foot over full lake level on the 5th. Discharges from the reservoir caused some lowland flooding downstream although flood stage was not reached.		
Edisto River Basin	The various periods of heavy rainfall discussed above overlapped the Edisto Basin causing minor flooding on the North Fork at Orangeburg, S. C., from the 12th-14th and 18th-22d, and on the main Edisto at Givhans Ferry, S. C., the 18th and 20th-26th.	0	N.A.
Savannah River	Flooding which began at Clyo, Ga., in January ended on the 1st. Locally heavy rainfall of 1 to over 2.5 inches occurred over the North and South Carolina tributaries on the 3d and again on the 16th. A 24 hour amount of 5.2 inches was reported at Lake Toxaway, N. C., on the 18th. Flash flooding was believed to have occurred in the latter area. Light flooding began again at Clyo on the 9th and continued into June aided by the various periods of heavy local rain; the crest, 2.2 feet over flood stage, occurred on the 31st.	0	N.A.
Ocumlgee River Basin	Two periods of minor flooding resulted from the series of storms discussed above along portions of the Ogeechee River, a north branch of the Ocmulgee River. These were at Scarboro, Ga., the 6-8th and 19th and at Eden, Ga., the 9-14th and 23d-25th.	0	N.A.
	EAST GULF OF MEXICO DRAINAGE		
Tombigbee, Pascagoula and Pearl River Basins	Rainfall was well above normal over the southern half of Mississippi with monthly totals generally in the range of 7 to 11 inches. Heaviest amounts were during the first half of the month with amounts of 3 to 4 inches April 30-May 1 causing the Pearl River to go over flood stage at and below Jackson. Additional amounts of over 2 inches occurred the 6th-9th, causing the Pearl to crest 8 to 10 feet over flood stage from Jackson	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MAY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimage of Property Damage (thousands of dollars)
	EAST GULF OF MEXICO DRAINAGE-Cont'd		
	to Monticello. Downstream crests were in the range of 5 to 7 feet over flood stage. Flooding also occurred in the lower Pascagoula Basin where a crest 4 feet over flood stage was observed on the Leaf River at Beaumont, Miss., and less than a foot over flood stage on the lower Pascagoula River at Merrill, Miss. A crest nearly 6 feet over flood stage occurred at Franklinton, La., on the Bogue Chitto River, a tributary of the Pearl. Locally heavy rain on the 15th-17th caused minor flooding in the headwaters of the Tombigbee River at Fulton, Miss. Losses were mainly due to continued delay in planting of fields and suspension of timber cutting operations. Livestock and equipment were evacuated from the floodplain on the basis of flood forecasts.		
	UPPER MISSISSIPPI BASIN		
Mississippi River tributaries in Minnesota and Wisconsin	Flooding continued into May along a number of tributaries of the upper Mississippi River as a result of heavy rainfall in April. Several of these tributaries crested late in April and fell below flood stage during the first week of May. These included the St. Croix River at Stillwater, Minn., and portions of the lower Chippewa, Trempealeau, Black, Kickapoo, and Wisconsin Rivers in Wisconsin. Streams cresting early in May were the Crow, Rum, and lower Minnesota Rivers. In the Crow River Basin flooding ranged from nearly 5 feet at Delano, Minn., to about 3 feet downstream at Rockford, Minn. A crest 2.2 feet over flood stage occurred on the Rum River at St. Francis, Minn., on the 3d. Moderate flooding occurred on the lower Minnesota River which lasted until the 15th with crests ranging from nearly 4 feet over flood stage at Jordan and Chaska to 7.5 feet over flood stage downstream at Savage, Minn.	0	N.A.
Mississippi River tributaries in Iowa	Light flooding from the heavy rains of late April continued into May in portions of the Des Moines Basin and on the Cedar River at Conesville where a crest 1.3 feet over flood stage occurred on the 6th. Rains averaging about 0.5 inch over the upper Iowa River caused a secondary crest, 1 foot over flood stage at Marshalltown on the 4th. Flooding ended on the 3d at Humboldt on the West Fork of the Des Moines and on the 5th at Jefferson on the North Raccoon River, both of which crested in late April. On the main Des Moines River the crest of 3.6 feet over flood stage at Stratford on the 1st was augmented by flow from the Raccoon River to give a crest 2.5 feet over flood stage downstream at the Des Moines 14th street gage. Flooding was primarily of agricultural land.	0	N.A.
Illinois River (Illinois)	Flooding from the late April rains continued into May on the Illinois River at and below La Salle. Crests were in the range of 2 to 4 feet over flood	0	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	UPPER MISSISSIPPI BASIN-Cont'd		
	stage. At Beardstown and Meredosia crests were delayed and increased by heavy rains of up to 1.5 inches which fell over the lower basin on the 6th-7th. Flooding ended on the Illinois by the 21st.		
Meramec River Basin (Missouri)	Rain, averaging about 2 inches, and falling on already saturated ground on the 6th-7th caused minor flooding on the Big River and a crest nearly 4 feet over flood stage at Union on the Bourbeuse River. Downstream on the Meramec River from 1 to 2 feet of flooding occurred at Eureka and Valley Park.	0	N.A.
Upper Mississippi River Main Stem	Flooding continued from April along the upper reach from Libby, Minn., to Guttenberg, Iowa, and also along the lower reach from Grafton, Ill., to the mouth of the Ohio River except around St. Louis. Flooding on the latter reach crested in late April and ended by the 3d only to begin again within a few days as the flood wave from upstream approached. Along the middle reach in Iowa and northern Missouri flooding began early in May and became rather serious with damages estimated at $2,235,000, which includes $800,000 at Davenport, Iowa, and $250,000 at Keokuk. Crests were generally in the range of 3 to 5 feet over flood stage. Crests at Dubuque and Davenport were the third highest in this century while those at Clinton and Muscatine were the fifth highest during that period. Along the upper reach from Libby, Minn., to Guttenberg, Iowa, crests were generally 2 to 4 feet over flood stage. Damage estimates are not available for this reach but 5,000 acres were inundated in Aitkin County, Minn. Savings from flood warnings were estimated at $250,000 in Vernon County, Wis. On the lower reach of the Mississippi down to the mouth of the Ohio, crests were generally lower than those which occurred in late April ranging from 1 to 2.5 feet over flood stage below Grafton Ill. There was little additional damage beyond that given in last months report for the late April flooding. There was a period during May when all reporting stations on the upper Mississippi except Minneapolis, Minn. and St. Louis, Mo. were above flood stage.	0	N.A.
	MISSOURI BASIN		
Upper Missouri Basin	The snowpack over the headwaters of the Missouri and Yellowstone Rivers as of May 1 was generally much above normal, ranging from 120 to more than 150 percent of the 1958-72 average. During the period April 28 to May 11 heavy precipitation occurred over much of this area with totals of 3.5 and 4.4 inches recorded for this period at Great	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	MISSOURI BASIN-Cont'd		
	Falls and Miles City, respectively. This precipitation, much of which occurred as rain over the lower elevations, combined with lower level snowmelt to cause overflows on many smaller streams in the area. Minor flooding occurred along the East Gallatin River near Bozeman, Mt. The only reporting station to go over flood stage was on the Shields River in the Yellowstone Basin which exceeded flood stage slightly at Clyde Park, Mt. on the 13th. Damage was limited to secondary roads and bridges. On the 6th rains of 4 to 9 inches were reported over the Box Elder Creek drainage in southeastern Montana. The resulting flood crest was said by residents to have been 4 feet higher than any previous crest in the last 50 years. There are no reporting stations on the stream. A rise to bankfull stages occurred on the Little Missouri River downstream from Box Elder Creek with no damage reported, although a picnic ground was flooded near Medora, N. D.		
Moreau River Basin (South Dakota)	Rains of 4 to 5 inches on the 5th-6th over the headwaters of the South Fork of Moreau River caused some flooding. No stage reports are received from that stream. One family was forced from their home at Hoover, S. D., and damage to some bridges and culverts was reported. A sharp rise occurred on the Moreau River downstream which crested about three-quarters bankfull on the 10th.	0	N.A.
James River	Rains of 1 to 2 inches over the headwaters of the James in North Dakota combined with snowmelt to cause flooding downstream at Columbia, S. D., early in the month. A crest about 2 feet over flood stage occurred there on the 15th. Flooding began late in the month downstream at Stratford, S. D., and continued into June at both locations. The crest at Columbia was caused in part by heavy rains on the 10th-11th over the Elm River watershed which empties into the James just below Columbia. The heavy inflow from the Elm caused backwater on the James at Columbia.	0	N.A.
Little Sioux River (Iowa)	Flooding from the heavy rains of late April continued into the first week of May. Locally heavy rains above Linn Grove caused a brief period of minor flooding there the 14th-16th.	0	N.A.
Kansas River Basin	The first three weeks of May were abnormally dry, however frequent thundershowers the last 10 days of the month produced strong rises on several streams which in most cases crested below bankfull stages. On the 22d-23d rains averaging 1 to 2 inches occurred over eastern Kansas. On the 27th-28th amounts of up to 3 inches fell over eastern and northcentral Kansas. Amounts of over 4 inches occurred the 28th-29th over northwest Kansas into east central Colorado producing minor overflows on Ladder and Sappa Creeks. On	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	MISSOURI BASIN-Cont'd		
	the 30th heavy rain again occurred over northern Kansas with Soldier Creek cresting nearly 2 feet over flood stage at Delia. This was the only reporting station over flood stage during the month.		
Lower Missouri River Basin	Rains of 3 to 4 inches over the Marais des Cygnes Basin on the 22d to 23d produced strong rises on Pottawatomie Creek and the Marais des Cygnes River which crested below flood stage. Similar amounts occurred again on the 28th-29th with similar results. An isolated storm with 2 inches of rainfall caused urban flooding in Ottowa, Kansas, the evening of the 29th.	0	N.A.
	Heavy rain fell over northwest Missouri on the 29th-30th with amounts of up to over 4 inches. Minor flooding occurred on the Platte River at Agency and a crest 4 feet over flood stage at Sumner on the Grand River where flooding continued into June.		
	Rainfall averaging about 2 inches over the extreme lower Missouri the 7th-8th combined with backwater from the flooding Mississippi to cause minor flooding at St. Charles, Mo., on the 7th-9th.		
	OHIO BASIN		
Middle Ohio Basin	Several flash flood events occurred during May from locally heavy thundershowers. No river flooding was reported during the month in this area. During the night of the 17th-18th flash flooding occurred along Shelby, Beefhide, and Elkhorn Creeks, which are headwater tributaries of the Levisa Fork of the Big Sandy River in Kentucky. Losses were estimated at $4 million with 160 mobile homes damaged, 20 bridges washed out, and 2 lives lost. Flooding was said to have been more severe than that of 1957 or 1963. Severe flash flooding also struck Pound, Va., on the Pound River as a result of this storm. More than 100 homes and businesses were flooded and 250 people were evacuated. Damage was estimated at about $300,000. Rainfall totals of 4.9 and 4.1 inches were reported at North Fork Dam, Va., and Burdine, Ky., respectively, for this storm.	2	4,310
	Late on the 18th an isolated thunderstorm deposited 4.7 inches of rain on Sabine in Wyoming County, W. Va. Flash flooding along Laurel Fork, a tributary of the Guyandot River, affected the communities of Ravencliff, Sabine, Glen Fork, and Matheny. A store and several homes were damaged in Glen Fork with damage estimated at $10,000.		
	Early on the 27th an isolated thunderstorm (amount of rain unknown) caused flash flooding along Hughes Creek in Kanawha County, W. Va. In the community of Happytown, 4 automobiles were lost		

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MAY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	OHIO BASIN-Cont'd		
	and 19 homes were flooded to varying degrees.		
Lower Ohio River Basin	Isolated thundershowers caused minor flooding along the Licking River at Salyersville, Ky., on the 19th and flash flooding in the headwaters of the North Fork of the Kentucky River where Troublesome Creek flooded Hindman, Ky., Neon, and Fleming on the 23d. A crest about 5 feet over flood stage occurred at Neon. Minor flooding also occurred on the 18th along the upper French Broad River in the headwaters of the Tennessee Basin. Except for these isolated events, flooding in the lower Ohio Basin during May was a continuation of that which occurred in late April as a result of the heavy rains of April 24-25. While crests occurred on some of the smaller streams in late April, crests on the lower reaches generally occurred early in May. On the lower Green River in Kentucky up to 5 feet of flooding was reported. In the Wabash Basin a crest 3 feet over flood stage occurred on the lower Embarras River, 4 to 5 feet of flooding on the lower White River, from 5 to 11 feet of flooding along the Little Wabash and minor flooding on the lower Wabash at Mt. Carmel, Ill. On the Ohio River below Louisville, Ky., all reporting stations were over flood stage by May 1 except Evansville where no flooding occurred. Crests ranged up 11 feet over flood stage. At Cairo, where a crest 7 feet over flood stage occurred on the 2d, flooding ended by the 16th.	0	N.A.
	WHITE BASIN		
Black, White and Cache Rivers	Flooding continued from April on the Cache River at Patterson, Ark., and the lower Black and White Rivers. The major crest on the lower Black River at Black Rock, Ark., occurred on the 1st, 3.7 feet over flood stage, and resulted from the heavy rains of late April. These rains also caused minor secondary crests on the Cache and lower White Rivers early in May which were well below the major crests of April. Below normal rainfall during May over much of the basin aided the recession and all streams were below flood stage by the end of May.	0	N.A.
	ARKANSAS BASIN		
Middle Arkansas Basin in Oklahoma	Average monthly rainfall was from 1 to 4 inches above normal with the greatest departures in the north-central part of the State. Severe flash flooding occurred at Stillwater in the Cimarron Basin on the 13th. More than 4 inches of rain occurred in one and one half hours. Cars were washed off roads and carried downstream. About 200 people were evacuated from homes. No deaths	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MAY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ARKANSAS BASIN-Cont'd		
	were reported. The Cimarron River crested about 2 to 2.5 feet over flood stage from Dover down to Perkins. This storm also caused flooding along Bird Creek, a tributary of the Verdigris River, with crests of 3 to over 6 feet above flood stage. Minor flooding occurred on the North Canadian River at Watonga. There were two other periods of locally heavy rainfall during the month which caused flooding on some streams in the basin. Minor flooding occurred along the Deep Fork and Poteau Rivers from the 5th to the 8th and along Bird Creek and the Cimarron and Little Rivers beginning on the 23d. Most serious flooding during the latter part of the month was on the Deep Fork River with a crest 4.4 feet over flood stage at Beggs. This flooding continued into June.		
	RED BASIN		
Red River tributaries in Oklahoma	Locally heavy rainfall caused minor flooding along the Blue River on the 3d and a crest 3 feet over flood stage at Waurika on Beaver Creek on the 25th.	0	N.A.
Sulphur River	Frequent rainfall occurred over the basin from April 28 to May 7 with several amounts of more than an inch. This resulted in crests 2 feet over flood stage at Hagansport, Tex., on the 3d and 5.2 feet over flood stage at Naples on the 8th. Rains of more than 2 inches over the lower portion of the basin caused minor flooding at Naples on the 21st-22d.	0	N.A.
Ouachita, Black and Lower Red Rivers	Flooding along the Ouachita which began in March ended at Monroe, La., on the 1st. Monthly rainfall totals were above normal with up to 15.5 inches reported over the lower basin for the month. Heavy rainfall of more than 2 inches on the 2d-3d following a wet period caused flooding to begin again on the 3d. A crest 7 feet over flood stage occurred at Camden, Ark., on the 8th. From 2 to 4 feet of flooding was reported downstream in Louisiana which continued into June. Bayou Bartholomew was reported out of banks at many places on the 15th. Flooding continued from April along the Black River with a second crest about 3 feet over flood stage the middle of May. Flooding also continued on the Lower Red River below Alexandria, La. and lasted into June along both streams. Urban flooding was reported in Ruston, La., on the 7th where 2 inches of rain fell in 30 minutes. Urban flooding from a heavy thunderstorm occurred at Bastrop, La., on the 24th where a two-year old child was swept away in a drainage ditch and drowned.	1	20,352

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MAY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	RED BASIN-Cont'd		
	Damages indicated are in addition to those reported in April. At the crest of the flooding along these streams 1,059,518 acres were inundated and an additional 95,665 acres were affected by seepage around protective levees. Acreage affected includes 281,665 acres of soybeans and 29,450 acres of cotton. About 16,000 head of cattle were evacuated with more than 4,000 forced into sale. At the end of May 125 families had been able to return to their homes in Avoyelles Parish but 487 families were still displaced from their homes.		
	LOWER MISSISSIPPI BASIN		
St. Francis River	Flooding from the heavy rains of late April continued until May 9 at St. Francis with a crest about 2 feet over flood stage there on the 2d. Locally heavy rain of at least 2 inches on the 11th-12th brought the river up to slightly over flood stage on the 12th-13th.	0	N.A.
Yazoo and Big Black Rivers	Flooding on the Yazoo which began in March continued into May at Yazoo City in recession from the major crest of April. Heavy rainfall during the first half of the month prolonged the flooding until the 28th. Rainfall totals for May ranged up to the 15 inches which occurred over the lower Big Black Basin. Most of this rain fell during the first part of the month with more than 2 inches around the 1st causing the Big Black to go over flood stage again. Flooding persisted most of the month with crests 5 to 7 feet over flood stage on the 11th-12th.	0	G
Lower Mississippi Main Stem	Flooding continued from late April at New Madrid and Caruthersville, Mo., cresting 2 to 3 feet over flood stage early in May and ending about the middle of the month. This flooding resulted from a flood wave moving down from the upper Mississippi which, combined with heavy rainfall over Louisiana and central Mississippi (discussed above), caused minor flooding at Vicksburg and Natchez, Miss, and Donaldsonville, La., and a secondary crest 3.7 feet over flood stage at Red River Landing, La. where flooding had persisted since March. Flooding at Baton Rouge which also began in March ended on the 1st. Severe flash flooding occurred in Tallulah, La., on the 22d resulting from 3 inches of rain in less than 45 minutes. The ground floor levels of several retail and commercial establishments were flooded and about 20 homes were flooded. It was reportedly the worst flooding in 20 years. Widespread urban flooding occurred on the 29th-31st in coastal areas southwest of New Orleans. Clovelly Farms, La., recorded 13.7 inches in 18	0	G

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	LOWER MISSISSIPPI BASIN-Cont'd		
	hours on the 29th-30th. Among the communities affected were Houma and Larose.		
	WEST GULF OF MEXICO DRAINAGE		
Atchafalaya River Basin	Flooding which began at Morgan City, La., in February continued through May into June. The stream was generally in recession from the crest in April which was slowed by excessive rainfall during the month. Morgan City received 7.26 inches of rain in 24 hours on the 29th-30th. Urban flooding occurred in Morgan City, Gibson, and several other communities.	0	N.A.
Calcasieu River	Rainfall was excessive over much of the basin during May ranging from about 6 to 17 inches with the heavier amounts in the headwaters of the stream. Much of this rain occurred during the period April 29 to May 1 resulting in record flooding at Hineston, La. The peak stage of 19.29 there on the 5th was the highest observed in 20 years of record. However, a stage about 2 feet higher was said to have been reached in May 1953 before records began. Downstream flooding was in the range of about 3 to 3.5 feet. Heavy rains on the 24th-25th and again the 29th-30th caused flooding at Hineston which continued into June cresting nearly 4 feet over flood stage on the 31st.	0	N.A.
East Texas Streams	Rainfall was above normal over the area during May with monthly totals of 7 to nearly 11 inches. Locally heavy amounts of 1 to over 5 inches were common. Minor flooding occurred on the upper Sabine River at Emory and Mineola. The lower Sabine was over flood stage much of the month at Bon Weir and Deweyville where two periods of flooding were reported. A crest of 4.4 feet over flood stage occurred at Bon Weir on the 12th resulting from rains of 2 inches April 29 to May 1, more than an inch on the 8th-10th, and releases from Toledo Bend Reservoir. Late in the month rains of 2 to over 3 inches the 29th-30th caused flooding on the lower Sabine which continued into June. In the Neches River Basin minor lowland flooding occurred along Attoyoc Bayou and persisted the entire month on the Angelina River at Lufkin and the Neches River near Diboll, both points having been over flood stage for several months. In the headwaters of the Trinity River rains of up to 2.5 inches on the 20th-21st and from 1 to over 4 inches on the 24th-25th caused serious flooding. Chambers Creek crested 4.4 feet over flood stage at Corsicana and levee failures along the stream inundated 40,000 acres. Downstream the Trinity River crested 4 to 6 feet over flood stage from Trinidad to Long Lake. In Navarro County 25 head of cattle were drowned and agricultural damage totaled $150,000. Flooding continued from	0	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	WEST GULF OF MEXICO DRAINAGE-Cont'd		
	April on the lower Trinity with a secondary crest 3.6 feet over flood crest at Moss Bluff. This flooding continued into June prolonged by releases from Lake Livingston and heavy rains which totaled 8.5 inches for the month at Liberty.		
Brazos and Colorado River Basins (Texas)	Amounts of 3 to over 5 inches were reported over the middle portions of the Brazos and Colorado Basins on the 24th-25th. The Navasota River, a tributary of the Brazos, crested 3.8 feet over flood stage at Easterly on the 26th and flooding is believed to have occurred downstream at Bryan but reports are missing. This flooding continued into June. The Colorado River crested 3 feet over flood stage at Columbus on the 26th.	0	N.A.
Lavaca River Basin (Texas)	Rainfall of 3 to over 4 inches on the 23d-24th caused serious flooding on the Navidad River, which crested 8 feet over flood stage at Ganado on the 27th with flooding continuing into June. The Lavaca River crested 2.4 feet over flood stage at Edna, also on the 27th.	0	N.A.
Guadalupe River Basin (Texas)	Two periods of flooding occurred in the basin during May. Rainfall of 1.5 to 3 inches in the Gonzales area and the San Marcos tributary basin caused flooding along the San Marcos with a crest 1.8 feet over flood stage at Luling on the 9th. Downstream on the Guadalupe River flooding occurred from Gonzales to the mouth with crests 2.4 to 6.5 feet over flood stage. Severe flash and urban flooding occurred during the evening of the 24th in the headwaters of the San Marcos River along Plum Creek with the communities of Lytton Springs and Lockhart affected. From 6 to 7 inches of rain fell over Plum Creek with Lockhart reporting 7 inches. Cars were washed off roads and some residents of Lockhart were evacuated. No lives were lost. Elsewhere in the basin 3 and 4 inch amounts were common with serious flooding on the Guadalupe from Gonzales downstream. Crests ranged from 13.6 feet over flood stage at Gonzales to 7 feet over flood stage at Dupont.	0	N.A.
Nueces River Basin (Texas)	Serious flooding developed from the storm of the 24th, which deposited rainfall amounts of 3.5 to 4 inches over the upper Nueces and Frio Basins and an estimated 6 inches over the lower Nueces below Cotulla. The Atascosa River crested 11 feet over flood stage at Whilsett on the 26th and crests on the lower Frio River from Tilden to Calliham ranged from 7 to 14 feet over flood stage. The heavy inflow from the Frio River caused serious flooding on the Nueces River from near Three Rivers to Mathis Bridge with crests 11 to 13 feet over flood stage. Less serious flooding of 2 to 3 feet occurred above and below this reach. Locally heavy rains on the 29th-30th helped to prolong this flooding into June.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MAY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	WEST GULF OF MEXICO DRAINAGE-Cont'd		
	Severe flash flooding occurred near Corpus Christi the morning of the 1st. Chapman Ranch reported 7.5 inches of rain in 2 hours. People were rescued from cars and homes in the vicinity of Portland. From 1.5 to 2.5 inches in Corpus Christi caused urban flooding there.		
	GREAT BASIN		
Humboldt River	The snowpack in the headwaters of the Humboldt River was more than 150 percent of normal as of May 1. Melting of this snowpack during May produced minor lowland flooding around Winnemucca, Nevada, late in the month which continued into June. No flood stages have been established along the stream.	0	N.A.
Great Salt Lake Basin	An unseasonably heavy snowpack along the Wasatch Range in north central Utah caused a threat of serious flooding during May. However, only relatively minor flooding resulted due to a favorable temperature pattern during the month. Some residential damage was sustained along Emigration Creek in Salt Lake City and the lower Ogden River in Ogden which was estimated at $75,000. Flood protection costs were estimated at $125,000.	0	200
	PACIFIC SLOPE DRAINAGE		
Columbia River Basin	The spring of 1975 was unusually cool--the second coolest spring in 95 years of record at Spokane, Wash. As a result an unusually heavy snowpack was carried over into May. During the period of the 10th-16th temperatures ranged up to 13° above normal. Significant rises occurred on streams in all parts of the basin with minor farmland flooding along the Colville, Cour d'Lene, and Clark Fork Rivers. The Cour d'Lene River crested at flood stage on the 16th at Cataldo, Id. The Cohill River crested at 8.4 feet at Kettle Falls, Wash., where the established flood stage is 9 feet and the Clark Fork River also crested at 8.4 feet at Drummond, Mt., where no flood stage has been established. The Columbia River crested at 14.3 feet on the 19th at Vancouver, Wa., where flood stage is 16 feet. Due to the favorable temperature regime during the melting season this was the high stage for the year at Vancouver. The average stage at Vancouver was 2.8 feet, below the long term normal for May.	0	N.A.
	ALASKA		
Kuskokwim River	The Kuskokwim began its breakup the first week of May and the ice went out at McGrath on the 12th. An ice jam formed downstream of McGrath the same day causing McGrath to flood. The river crested at 23 feet, 2 feet over flood stage when the jam broke at 9 p.m. of that day. No damage informa-	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

MAY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ALASKA-Cont'd		
	tion is available. The breakup of the ice jam completely flooded the village of Sleetmute downstream. The village runway was 80 percent flooded. On the 15th another major ice jam formed downstream of Aniak causing Aniak to flood. The jam held for 3 days and upon breaking, the resultant release of water flooded Upper Kalskag and Lower Kalskag. Additional jams occurred throughout the lower Kuskokwim as the breakup progressed to the mouth by the last week in May. Minor flooding occurred at Toluksak, Akiachak, Akiak, Kwethluk, Napakiak, Oscarville, and Napaiskak. Major flooding at Bethel raised the stage to 13.25 feet. Flood stage there is 9 feet. A total of 67 homes and 2 businesses in Bethel were flooded; and one home which was flooded also burned; 112 people were evacuated from Oscarville and Napakiak and at one time 135 persons were staying in temporary quarters in Bethel.		
Yukon River Basin	The spring breakup began ine first week in May on tributaries of the Yukon River. The Tenana River was the first to break up and reached bankfull stages along much of its reach but no flooding was reported. The Koyukuk River broke up quickly and uneventfully. No serious ice jams formed and no flooding was reported. The Chena River breakup was a very slow process with the ice melting and moving out of the lower Chena entirely within the first week of May. There were no reported ice jams of any consequence. Unseasonably warm temperatures occurred in the second week of May in the Tanana Valley and Upper Yukon Valleys. As a result, rapid rises were noted in the streams in which the ice had broken up, including the Chena, Chatanika, and Salcha rivers. The Chena River at 38 mile Chena Hot Springs Road rose to a stage of 20.7 feet, the highest recorded since the 1967 Fairbanks flood. Minor flooding and road washouts occurred in that vicinity, closing the road and isolating 2 small construction camps and 2 resort areas. Construction equipment had to be moved to safeguard it and evacuations of 8 individuals was necessary. During the "heat wave," Fairbanks temperature reached 80°, and the average temperature on the 12th was 20° over the normal for the day. Considerable ponding took place as a result of overbank flooding upstream of Fairbanks. A few homesteads were flooded but no buildings were reported damaged by water. The Chena at Fairbanks crested at 10.6 feet, 1.4 feet under flood stage. During the same period, the Salcha River at Salchaket crested at 15.8 feet, flooding a state campground and a few recreational cabins in the upper reaches. Damage was very slight. The Chatanika River also was overbanks and although one family was forced to leave their homestead, the only damage was reported at 50 mile Steese Highway where the road washed out. A campground at 38 mile	0	N.A.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ALASKA-Cont'd		
	Steese Highway also flooded. Two villages and a resort area were cut off from ground transportation during the washout and flooding. The Yukon River began breakup in Alaska on the 11th. Primarily as a result of the higher than normal temperatures, breakup in the upper Yukon was quite rapid and, with the exception of minor flooding at Fort Yukon, uneventful. An ice jam at Fort Yukon caused a few streets in Fort Yukon to flood for 2 days but no damage was reported. A major ice jam occurred near Holycross on the Yukon River on the 18th of May and dammed the river for 6 days. The village of Anvik was flooded and 37 persons had to be evacuated to Bethel. The power plant, school, and 16 homes were flooded. Residents of Anvik referred to this flooding as the "worst in the history of the village." The previous high flood was in 1972, also from an ice jam at the same location. The water dammed behind the Holycross jam, joined the Yukon River with the Innoko, Bonasila, and Anvik rivers in one large lake estimated at an area of 1000 square miles. Grayling was also flooded by the jam. At Grayling, 2 houses were flooded and six basements filled with water. Eleven houses were surrounded by water and cut off from the remainder of the village. This was also Grayling's highest known flood. On the 24th, 2 ice jams downstream of Pilot Station caused flooding at Pilot Station and 22 houses were in water for 1 day. Ice jams at the mouth of the Yukon caused the villages of Emmonak and Alakanuk to flood on the 29th until the morning of the 31st. During the flooding at Emmonak, the runway was covered (6" at the high end), 36 houses received water damage above the first floor level, and 3 houses had physical damage from ice chunks or floes moving through the village. At Alakanuk 49 houses had water damage, 2 physical damage from ice floes and 5 fishing boats were crushed by ice. Transformers and utilidors of the new power system in Alakanuk were also flooded. A lake also formed on the delta at this time covering approximately 1045 square miles.		
Kobuk River	The town of Kobuk and its airstrip were completely flooded by backwater from ice jams. Residents were evacuated to Shungnak.	0	N.A.

NO DATA AVAILABLE

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code as prescribed in the August 1962 WMO circular entitled PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA.

Units: Milli-atm-cms.

Station	Day of month																															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	[illegible]

NO DATA RECEIVED

REFERENCE NOTES

[illegible] EXTREMES OF TEMPERATURE AND PRECIPITATION -- [illegible]: Dates in the table apply to the period 24 hours prior to time of observation. In some cases the actual occurrence is on the calendar date preceding that shown. See individual climatological data for times of observations.

- + And also on an earlier date or dates.
- D Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch of water equivalent to every 10 inches of snowfall.

CLIMATOLOGICAL DATA - METRIC UNITS: Data from airport unless otherwise specified.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile data can be evaluated.

- B Number of days maximum 21.1°C. or above for Alaskan Stations.
- Y Peak Gust.
- + And also on an earlier date or dates.
- U Indicates Urban site.
- R Indicates Rural site.
- 0 Station pressures apply to elevations shown in the "Elevations" table of the annual issue of this publication.

Conversion formulae to English Units are as follows:

1 foot = 0.3048 meters
°F = 9/5 °C + 32
1 inch = 25.4 millimeters
1 mile per hour = 0.447 meters per second

HEATING DEGREE DAYS: Data from airport unless otherwise specified.

- U Indicates Urban site.
- R Indicates Rural site.

COOLING DEGREE DAYS: Data from airport unless otherwise specified.

- U Indicates Urban site.
- R Indicates Rural site.

STORM SUMMARY:

- ° Includes crop damage.
- C Crop damage.
- * No occurrence of storms or unusual weather phenomena reported.
- @ Includes heavy sleet storm.
- # Freezing drizzle and freezing rain, commonly known as glaze.
- 0 For breakdown of "All Others," and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
- ‡ No Storm Data Report received for this State.
- <> Report Incomplete.
- † Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5 Million
7	$5 Million to $50 Million
8	$50 Million to $500 Million
9	$500 Million to $5 Billion.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS:

- 1/ Flooding continued at the end of the month.
- NA Not available.

FLOOD STAGE DATA:

- # Highest Stage Observed
- 1/ Continued at end of month
- ___ Highest Stage of Record
- E Estimated
- P Provisional (Flood Stage)
- U Unknown

RAWINSONDE DATA (Average Monthly Values):

All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon. The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors. These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

- * Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.
  Observations for these stations are scheduled at 0000 G.C.T.
- · Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES: Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

()	Clouds Present	DM	Moderate Dust	HM	Moderate Haze	FS	Slight Smoke
*	Values corresponding to true solar noon	DS	Slight Dust	HS	Slight Haze	M	Moderate Haze-indeterminable
BD	Blowing Dust	F	Fog	I	Intense Haze-indeterminable		
BN	Blowing Sand	GF	Ground Fog	K	Smoke	N	Sand
D	Dust	H	Haze	KI	Intense Smoke	S	Slight Haze-indeterminable
DI	Intense Dust	HI	Intense Haze	KM	Moderate Smoke		

NET RADIATION: The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA: These data are from an U-V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA: The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded $\Omega\ \Omega\ \Omega$) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

JUNE 1975

GENERAL SUMMARY OF WEATHER CONDITIONS

Dr. Richard E. Felch, Climatologist

IGHTS: The heaviest precipitation amounts for
onth were reported in southwest Mississippi and
east Louisiana, where 8 to 12 inches fell. New
ns received 12.28 inches, the wettest June on
d. Unofficial reports of over 17 inches came
the Houston-Galveston area. Over 8 inches also
in parts of Kansas, Missouri, Minnesota, and
da. No rain fell in most of New Mexico, Ari-
southern California, and southern Nevada.

ts were generally above normal over the Great
s and the Corn Belt. Exceptions included nor-
Missouri, eastern Iowa, southern Illinois and
na, and central Ohio. Parts of Kentucky, Ten-
e, and the Carolinas were very dry.

ratures averaged within 2° of normal in most
. The Rocky Mountain States, the southern
Plains, and the Appalachians were cooler than
. The western tier of States and most of the
were warmer than usual.

PITATION: The first half of June included con-
able violent weather. Tornadoes, high wind,
ail were reported from Montana to Texas and
ard to Florida and New England during the first
At least one tornado, wind, hail, and flash
ing occurred in Nebraska and Kansas on the 2d.
and hail was common in the Northern Plains and
na on the 3d. On the 6th thunderstorms raged
the Atlantic Coast. A station in north cen-
Mississippi reported over 4 inches in just one
Heavy thunderstorms continued through the
in the Plains.

iolent weather continued as 17 inches of rain
at Sourlake, Texas, in a matter of a few hours
e 9th. Tornadoes were reported in central
and the Houston area. In contrast, snow fell
e Colorado Mountains. The all-day snowfall at
ado Springs set a record for so late in the
n. Friday the 13th brought tornadoes to Min-
a, Wisconsin, Iowa, Illinois, Indiana, and Ok-
a, with heavy damage at Stillwater.

Typical of late spring, thunderstorms with associated severe weather were rampant from the Plains to the East Coast during the third week of June. Tornadoes and hail were reported in eight States on the 17th. Serious agricultural flooding occurred in east central Kansas. By the 18th flooding had occurred from the foothills of the Rockies to the Missouri Valley and south to Kansas.

Precipitation was variable during the closing week of the month as scattered thunderstorms dropped locally heavy amounts. Eastern North Dakota and adjacent areas reported severe weather on the 28th with tornadoes, high winds, and hail. The severe weather continued over the weekend with serious flooding occurring, with heavy crop damage.

The first tropical storm of the season, "Amy", developed off the North Carolina coast on the 29th.

TEMPERATURE: The first week of June temperature trends were towards warming in the West and cooling in the East. The South was near normal all week.

The second week was much cooler than normal except for the Far West. A number of record low temperatures were measured throughout the week. The West was unusually warm as readings climbed well into the 90's.

The last week of Spring, cool air hovered over the Rocky Mountains and pushed into the High Plains. However, temperatures averaged well above normal in the eastern half of the Nation with the North Central States 4 to 9° above normal.

Temperatures continued above normal in the Corn Belt and Northeast, but was cooler than normal over the remainder of the Country.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JUNE 1975

Herbert J. Thompson
Office of Hydrology

The most significant event during June was the beginning of major flooding in the Red River of the North Basin. A record crest occurred at Enderlin, ND, on the Maple River. Record flood crests also were reported on Squaw Creek and the South Skunk River near Ames, IA, the Mussellshell River at Harlowton, MT, Pine Island Bayou at Sour Lake, TX, and on the Clark Fork River above Missoula, MT.

Losses running into millions of dollars were reported in the South Skunk Basin in Iowa, the headwaters of the Missouri River in Montana, the lower Neches Basin in Texas, and the Wabash Basin in Indiana. Serious losses also occurred in the Kansas and Marais des Cygnes River Basins and the Arkansas River Basin all in Kansas. Less significant flooding occurred in several other sections of the country.

A number of urban or flash flood events occurred during June with Indianapolis, IN, and Houston and Beaumont, TX, among the communities affected.

Delayed data on snowmelt flooding in the Snake River Basin in Idaho is included in this month's report.

These and other hydrologic events of unusual significance or involving loss of life or property damage are discussed in more detail below.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	HUDSON BAY DRAINAGE		
Souris River Basin (ND)	The major flooding which began in April continued into June at and below Foxholm ending during the first week above Verendrye. Heavy rains on the 9th-10th with Minot reporting a total of 2.65 inches probably helped to prolong the flooding downstream at Bantry and Westhope, where flooding continued into July.	0	N/A
Red River of the North Basin	Major flooding began late in June which reached record proportions in July on some streams. Rains of 3 to 4 inches over the southern portion of the Red River on the 19th-22d caused the South Buffalo, Buffalo, and the Red River at Fargo to exceed flood stage on the 21st and saturated the ground for the rains of the 27th to July 1, which caused the serious flooding. This period of rain was the result of a stagnating flow pattern at the surface which set up moisture instability, and low level jet conditions that caused repeated thunderstorm activity over the same general area during the period. The location of the principal heavy rain areas seemed to be closely associated with the low-level jet axis, low-level jet speeds, and speed gradient along streamlines. Upper-air features normally associated with precipitation appeared to play a less significant role. The rain with the upper air systems became more intense as these systems came into the low-level jet region, although the high moisture and low stability of the area may have been as much responsible as the low-level jet winds. The heaviest	0	N/A

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JUNE 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	HUDSON BAY DRAINAGE-Cont'd		
	storm total of 20.6 inches was reported about 25 miles southwest of Fargo and totals in excess of 8 inches occurred over an area 20 to 30 miles wide from northeast La Moure County in North Dakota to southeast Mahnomen County in Minnesota. From 4 to 8 inches fell over much of the remainder of the basin during the period.		
	By the end of June, most tributaries were over flood stage. However, the main stem of the Red didn't exceed flood stage until early July except at Fargo. In general, streams crested in July, but the upper Maple River crested on the 30th 9.4 feet over flood stage at Enderlin, ND, where one-third of the residents were evacuated. The crest of 15.41 feet at Enderlin exceeded the previous record crest of 13.55 feet which occurred in 1969. The town of Kathryn, ND, in the Sheyenne River Basin was affected by flash flooding from Spring Creek with residents evacuated early on the 29th.		
	ST. LAWRENCE DRAINAGE		
Great Lakes Tributaries	Urban and/or flash flooding occurred at several points in the Great Lakes area during June. A band of rain with locally heavy amounts in excess of 3 inches occurred from eastern Wisconsin across central Michigan on the 24th. Urban flooding was reported in several areas including Milwaukee, WI, and the Detroit, MI, metropolitan area.	0	N/A
	In New York urban flooding was reported in Chautauqua County on the 5th and the Springville-Ashford Hollow-West valley area of the Cattaraugus Creek drainage on the 19th. Tributaries of the Genesee River crested about three-quarters bankfull on the 20th.		
	ATLANTIC SLOPE DRAINAGE		
Delaware River Basin	Flash and urban flooding was reported in the Reading, PA, area on the 28th with more than 2.5 inches of rain in 6 hours. Rains of 2.4 inches on the 5th and 1.4 inches on the 12th caused urban flooding in the Wilmington, DE, area. Urban flooding was reported in parts of Newcastle County, DE, on the 19th.	0	N/A
Susquehanna River Basin	Average rainfall for June over the basin totaled 5.93 inches--144% of normal. Flow of the Susquehanna River averaged 152% of normal. Rains of 1.5 to 2.5 inches on the 5th-7th caused strong rises on most streams which crested below flood stage except along the Chemung River which crested near flood stage.	0	0
Coastal Basins North Carolina to Georgia	Relatively minor flooding occurred on several streams in these basins during June. In addition to the heavy rains of May 30-31, an additional 1 to 3.4 inches fell over the area on June 1. The	0

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JUNE 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	Rocky River at Norwood, NC, the Peedee River at Cheraw, SC, and the Broad River at Gaffney, SC, all slightly exceeded flood stage the 1st or 2d. Flooding continued from late May on the Broad River at Blair, SC, ending on the 3d. The lower Peedee River crested 2.6 feet over flood stage on the 7th at Peedee, SC, and the Lumber River crested about 1 foot over flood stage at Lumberton, NC, on the 5th. In the Wateree Basin both Lookout Shoals and Wateree Reservoirs exceeded full pool elevation by 1.9 and 1 feet respectively.		
	During the period of the 9th-12th, rainfall amounts of up to 3.5 inches occurred. The Roanoke River reached flood stage at Williamston, NC, on the 13th-14th and Lookout Shoals Reservoir again exceeded full pool elevation, this time by 2.6 feet.		
	Lowland flooding on the lower Savannah River continued from May ending on the 13th at Clyo, GA.		
	Losses were light. Construction work was halted for a few days on the Broad River at Parr, SC, and on the Congaree River at Columbia, SC. Warnings permitted the removal of equipment. Heavy releases from various reservoirs caused some lowland flooding downstream.		
	EAST GULF OF MEXICO DRAINAGE		
Appalachicola River	Rainfall in excess of 2 inches occurred over the upper and lower portions of the basin on the 10th-13th. Light flooding resulted on the lower reach of the river on the 13th-16th with a crest 1.7 feet over flood stage on the 15th at Blountstown, FL. The river again slightly exceeded flood stage on the 19th as runoff from the upper portion of the basin reached Blountstown.	0	N/A
Tombigbee River	Locally heavy rain on the 9th-10th over the headwaters of the Tombigbee caused a sharp rise on the river with light flooding at Amory, MS, where a crest 1.6 feet over flood stage occurred on the 11th. Some urban and flash flooding was reported in communities in the area with streets covered by 6 to 10 inches of water for a short period.	0	N/A
Pearl River Basin	Rainfall amounts for June were well above normal over the lower Pearl River Basin with monthly totals of 9 to 14 inches. Heaviest amounts occurred on the 9th-16th and totaled as much as 6 inches or more for the period. Flooding began on the 10th near Bogalusa, LA, with crests of 2.4 and 2.9 feet above flood stage near Bogalusa and Pearl River respectively the 12th and 14th. Some flooding also	0	N/A

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	EAST GULF OF MEXICO DRAINAGE-Cont'd		
	occurred along the Bogue Chitto Tributary on the 10th-12th with a crest 1 foot over flood stage at Franklinton, LA, on the 12th.		
	UPPER MISSISSIPPI BASIN		
Mississippi River Tributaries in Minnesota	Localized heavy rain of 7 inches on the 20th-21st caused light flooding on the South Fork of the Crow River which continued into July. A rise began along the Minnesota River below Mankato on the 11th due to rains of more than an inch moving east-northeast across southwestern Minnesota into central Wisconsin. Amounts of 4 inches on the 15th around Rapidan caused a crest within a foot of flood stage from Jordan downstream to below Savage late in the month.	0	N/A
Mississippi River Tributary Basins in Iowa	Record flooding occurred during June in the South Skunk River Basin around Ames. It was reportedly the worst flooding there since 1918 which was before modern records began. On Squaw Creek (flood stage 7 feet) the crest of 14 feet was well above the previous record of 10.74 feet, which occurred in 1970. A peak stage of 10.7 feet occurred in 1965 just prior to the beginning of records there. On the South Skunk River below Squaw Creek near Ames (flood stage 10 feet) the crest was 15.44 feet as compared to the previous high stage of 13.33 feet in June 1974. Records began there in 1952. Extensive flooding also occurred along the lower Cedar River, the Iowa River from above Marshalltown to Coralville Dam, and in the Des Moines River Basin. Except on the upper Des Moines River where a crest of 5.4 feet over flood stage occurred at Stratford, crests were generally in the range of 1 to 3 feet over flood stage. Several streams had more than one crest over flood stage due to the extended period of rainfall. Flooding was due to a series of general 1-2 inch rains on the 9th, 10th, 11th, 15th, 18th, and 22d which produced high but mostly within-bank river levels, and saturated soil conditions. This was followed by 3-5 inch rains in the Fort Dodge area in the Des Moines River basin and 2-5 inch rains on the North, Middle, and South Rivers the night of the 24th. Additional heavy rains fell during the night of the 26th with 2-3 inch downpours in two hours or less over Squaw Creek and South Skunk River from Ames upstream resulting in the record floods at Ames. Significant flood damage was confined to Squaw Creek and the South Skunk basins from above Ames to confluence with the Skunk River where 50,000 acres were flooded, of	1	5,250

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JUNE 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	UPPER MISSISSIPPI BASIN-Cont'd		
	which 40,000 acres was cropland resulting in damage of approximately $100 per acre, or $4 million. Rural property damage estimated at $250,000 and Ames property damage estimated at $1 million. In addition to roads and residential areas, several businesses and a substantial portion of the Iowa State University campus was affected. One death resulted from the Ames flood when a 13-year old boy drowned while wading in flood water.		
Illinois River (Illinois)	During the period of the 12th-15th, rainfall of more than 2 inches occurred over the upper and middle portions of the basin bringing the river over flood stage at La Salle and downstream at Havana and Beardstown where flooding continued into July. Crests at these points were in the range of 1 to 2 feet over flood stage.	0	N/A
	MISSOURI BASIN		
Upper Missouri Basin in Montana	Rains in excess of 2 inches along the Continental Divide during the third week of June caused major flooding along the east slope of the Rocky Mountains. Streams were already high from the annual snowmelt runoff and general rains much of the early part of the month which included 1.6 inches at Great Falls on the 9th. The Sun River crested at 21 feet (flood stage 15 feet) at Great Falls. Flooding along the Sun River was second only to that of the record flood of 1964. Damage around Great Falls was estimated at $17 million, with 20,000 acres flooded and 4,000 people evacuated. Less serious flooding occurred along the Big Hole, Jefferson, and Gallatin Rivers with crests in the range of 0.5 to 1.5 feet over flood stage. Major flooding occurred on streams in Glacier National Park with all highways closed. Major flooding was reported in Choteau from the Teton River and Spring Creek and also along the Upper Marias River. There are no reporting stations on streams in Glacier Park or on the Teton River or Spring Creek, while the Marias River at Shelby failed to go over flood stage. Widespread flooding of basements occurred in the Helena Valley from record stages on Ten Mile and Little Prickly Pear Creeks. No reports are received from these streams. Similar flooding occurred at Wisdom in the Big Hole Valley. A record crest stage of 10.02 feet occurred on the Musselshell River at Harlowton. This was 3 feet over flood stage and 1.3 feet above the previous record stage of June 1938. Widespread rural flooding was reported downstream to Fort Peck Reservoir.	0	21,000

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	MISSOURI BASIN-Cont'd		
	In the Yellowstone Basin, a crest 1 foot over flood stage was reported on the Shields River at Clyde Park.		
Cheyenne River Basin (South Dakota)	On the afternoon of the 7th, heavy, intense, local rain caused urban flooding in portions of Rapid City. Basements were flooded and driveways and sidewalks were damaged. However, Rapid Creek stayed within banks.	0	N/A
James River	Flooding continued from May on the James at Columbia and Stratford, SD. A second crest occurred on the 25th at Columbia, 4.3 feet over flood stage. Frequent light rains during the month with more than 1.5 inches upstream on the 9th-10th and 2 to 4 inches on the 19th prolonged the flooding and caused the crest at Columbia. Late in the month the unusually heavy rains which struck the Red River Basin June 28-June 1 (discussed above) overlapped into the James Basin with a 16-inch center just north of La Moure, ND. Flash flooding occurred on small tributaries at La Moure with a number of evacuations necessary. The James River crested near flood stage at La Moure.	0	N/A
Floyd River (Iowa)	Heavy thunderstorms occurred over the upper Floyd Basin during the night of the 3d-4th. Rainfall amounts of 1 to over 4 inches were reported. Widespread lowland flooding occurred down to Le Mars with crests of 2 and 4 feet over flood stage reported at Sheldon and Alton respectively. Minor flooding occurred at Alton on the 23d.	0	N/A
Little Sioux River (Iowa)	Flooding occurred again during June along the Little Sioux River. Rains in excess of 2 inches on the 3d to 4th caused flooding from above Spencer to below Linn Grove, with crests from 2 to 5 feet over flood stage. On the 21st 1 to 2 inches of rain caused flooding from Spencer down to Cherokee with crests up to 4 feet over flood stage. This period of flooding extended into July at Linn Grove.	0	N/A
Platte River Basin (Nebraska)	Rains of 7 to 12 inches occurred over much of east-central Nebraska the first 3 weeks of June thoroughly saturating the ground. Heavy showers on the 18th and 20th caused lowland flooding along Maple and Pebble Creeks. There are no reporting stations on these tributaries of the Elkhorn River. Up to 4 inches of rain on the 18th-19th over the upper Wood River Basin caused flooding in the town of Wood River. No reporting stations went over flood stage.	0	N/A

Clemson University Library

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JUNE 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	MISSOURI BASIN-Cont'd		
Kansas River Basin	Several periods of locally heavy rainfall occurred over the basin during June. On the 3d, 1.5 to 2 inches of rain caused flooding along the Black Vermillion River, a tributary of the Big Blue. A crest 6.6 feet over flood stage occurred at Frankfort, KS, on the 4th. Damage to corn and soybeans amounted to $10,000. On the 8th-9th general rains of 3 inches with isolated amounts of over 4 inches fell over northeast Kansas. Flash flooding occurred on small streams in the area. Soldier Creek crested 3 feet over flood stage at Delia, KS, and minor flooding was reported along the Delaware River. Agricultural damage was estimated at $90,000. On the 17th-18th, thunderstorm rainfall in excess of 5 inches occurred over Sappa and Prairie Dog Creeks and the headwaters of the Solomon River. Flash flooding occurred in Colby, KS, where several apartment buildings, 10 homes, 2 businesses, and many streets were inundated. Downstream on Sappa Creek the crest at Oberlin, KS, of 16.53 feet was only 0.04 foot below the record crest of 1956. Flood stage at Oberlin is 11 feet. Damage estimates include $525,000 residential, $75,000 public, $206,000 agricultural, and other losses of $71,000. On the 22d widespread rainfall of 1 to 3 inches occurred over the northern two-thirds of Kansas and south-central Nebraska. A secondary crest 3.5 feet over flood stage occurred at Oberlin and crests of 1.3 and 2.4 feet over flood stage were reported on the South Fork of the Solomon at Osborne and the Solomon River at Niles, respectively. The Little Blue River crested 1.7 feet over flood stage at Hollenberg, KS. The Smoky Hill River reached bankfull stages with no flooding reported.	0	977
Lower Missouri Tributaries in Northwestern Missouri	Flooding continued into June on the lower Grand River from the heavy local rains of late May. Monthly rainfall totals were well above normal along a band across extreme southern Iowa and northern Missouri with an amount of 9.4 inches reported at Clarinda, Iowa. There were two periods of locally heavy intense thunderstorm rainfall which caused generally light flooding on several streams in the area. The One Hundred and Two River crested 4.8 feet over flood stage at Rosendale, MO, on the 12th and the Platte River crested 2.6 feet over flood stage at Agency, MO, also on the 12th. The Little Blue River crested about 2 feet over flood stage on the 11th. Minor flooding	0	N/A

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	MISSOURI BASIN-Cont'd		
	with crests of 1 foot or less over flood stage occurred on the Nishnabotna River at Hamburg, IA, on the 26th and the lower Grand River at Brunswick, MO, on the 13th and 28th.		
Marais Des Cygnes River Basin	Widespread river and flash flooding occurred in the basin during the period of the 16th-23d with crest stages approaching those of the major flood of 1973. Rainfall on the 16-17th averaged 3.5 inches with amounts of over 5 inches reported. Additional rain fell on the 21st-22d causing a second minor crest at Reading, KS. Crests were in the range of 6 to 10 feet over flood stage on the main stem above Osawatomie, KS, and 1 to 4 feet over flood stage from Lacygne down to State Line, KS. Flooding also occurred on several tributaries including Salt Creek, upper Pottawotomie Creek and the upper Marmaton River with crests 3 to 5.5 feet over flood stage. Minor flooding occurred on the upper Little Osage River. Damage was primarily to crops, but some street, bridge, and residential damage was reported. Two to three day warnings enabled farmers to save a portion of the wheat crop along the reach from Osawatomie to State Line.	0	470
Missouri River Main Stem	The Missouri River exceeded flood stage at several points during June. It crested 0.5 foot over flood stage at Toston, MT, on the 24th due to heavy rains over the headwaters as discussed above. The heavy spring runoff in Montana with record flows in the Mussellshell and well above normal flows in the Missouri, Yellowstone, and Milk Rivers resulted in record pool elevations of the Fort Peck and Garrison Reservoirs. At Williston, ND, in the pool of Garrison Reservoir, flood stage was exceeded on the 10th and flooding continued into July. However, the town itself is protected by levees so only lowland outside the levees was affected. On the lower Missouri, heavy inflow from the several tributaries as discussed above caused minor flooding at St. Joseph and Lexington, MO.	0	N/A
	OHIO BASIN		
Kanawha River Basin	Flash flooding was reported from two small streams at Sutton, WV, where 3 inches of rain fell in 45 minutes on the 15th. Several small bridges were washed out.	0	N/A
Wabash River Basin	Rainfall over the upper portion of the basin was well above normal for the month with some stations receiving 200% of normal.	0	2,600

Clemson University Library

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JUNE 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	OHIO BASIN-Cont'd		
	Most of this rain occurred during the last half of the month with two periods of flooding resulting on the middle reach of the Wabash. The first period lasting from the 15th to the 22d was the most serious with crests ranging from 6 feet over flood stage at Lafayette, IN, to 1 foot over flood stage at Terre Haute. Minor flooding occurred on the 26th-28th from Lafayette to Montezuma. Crop losses were estimated at $2,500,000 by the Corps of Engineers with 25,000 acres affected. Severe urban flooding occurred in the westside of Indianapolis, IN, on the 25th. A record rainfall of 3.17 inches in one hour was recorded at Weir Crook Airport. The most serious damage occurred at the airport and was estimated at $100,000		
	WHITE BASIN		
Cache River	With the Cache River still at high stages and in slow recession from the long period of flooding which ended in late May, moderately heavy rainfall in excess of 1 inch on the 10th-11th and 15th-16th caused two brief periods of minor flooding the 13th-14th and 20th-28th.	0	N/A
	ARKANSAS BASIN		
Rattlesnake Creek	Rains of 2 to 4 inches fell in about 3 hours early on the 23d causing the most serious flooding of recent years, according to the Kiowa County Engineer. There are no gages along the stream. Because of frequent overflow onto the flood plain, there are no buildings to be damaged. However, 2 county bridges, the approaches to 11 others, and 35 roads were washed out.	0	225
Arkansas River Tributaries in Southeastern Kansas and Northern Oklahoma	Precipitation for June over southeastern Kansas averaged 137% of normal, ranging from 206% of normal in Kingman county to 78% in Chautaqua county. Chautaqua was the only county with below normal precipitation for the month. A ten-inch isohyet thirty miles in diameter was located 25 miles southwest of Wichita. An area with 9 to 13 inches of rain for June, thirty miles wide was located from near Cottonwood Falls, KS, to just east of Newton, KS. Florence, KS with 13.48 inches recorded the greatest precipitation for June and Cedarvale with 3.13 inches the least. Above normal monthly totals were also reported in the northern Oklahoma portion of the basin. Flash flooding occurred on three separate occasions inundating approximately 250,000 acres with an unknown dollar damage value. Five	0	N/A

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ARKANSAS BASIN-Cont'd		
	thousand acres were inundated in the Whitewater, Little Arkansas, and upper Walnut River basins on the 8th. Approximately 200,000 acres were inundated on the 16th on the Chikaskia, south fork of the Ninnescah, and upper Cottonwood River basins. On the 16th nearly 6 inches of rain fell in less than 6 hours at Florence, KS, on the Cottonwood River. An area 30 miles in diameter and located about 25 miles southwest of Wichita received 5 to 6 inches of rain on the evening of the 16th. Greatest damage occurred to the ripening wheat crop, with lesser damage to milo and alfalfa. Bridges, roads, and culverts also suffered damage. Flash flooding to a lesser degree occurred in the towns of Peabody and Florence, KS.		
	Main stream flooding occurred on the Cottonwood, Verdigris, Little Arkansas, Whitewater, Ninnescah, Chikaskia, and lower portions of the Walnut, Neosho, and Arkansas River basins. Crests were generally 1 to 5 feet above flood stage. Exceptions to the above were on the Chikaskia River at Corbin, KS, where a crest of 22 feet occurred on the 17th. This was 12 feet above flood stage. At Cedar Point, KS, Cedar Creek crested at 17 feet, 7 feet above flood stage.		
	In Oklahoma flooding was reported on Black Bear Creek and the Salt Fork, Cimarron, Little, Deep Fort, Poteau, and Chikaskia Rivers. Crests were generally in the range of about 1 to 3 feet over flood stage except on the Chikaskia River at Blackwell and the Poteau River where 5 to 6 feet of flooding occurred.		
	Extensive crop damage occurred, particularly to wheat, but the amount is not known. Damage to bridges, roads, and culverts amounted to $543,000 and other losses, including the cost of flood protection totaled $1,050,000.		
	RED BASIN		
Red River Tributaries in Oklahoma and Texas	Heavy localized thunderstorm rainfall caused some flooding on the Salt Fork, Washita, and Blue Rivers in Oklahoma during June. Crests were in the range of 1 to 2.5 feet over flood stage. Flooding of pastureland occurred along the Sulphur River in Texas with crests of 2.5 and 3.7 feet above flood stage at Hagansport and Naples, respectively.	0	N/A
Ouachita River Basin	Flooding continued from May on the lower Ouachita, ending on the 9th at Monroe and Columbia Lock & Dam, LA. Rainfall during June was well above normal; 3-5 inches above normal over the mountainous headwaters. Heaviest rainfall	0	N/A

Clemson University Library

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	RED BASIN-Cont'd		
	occurred during the period of the 11th-14th and caused only minor flooding on the Ouachita River from Camden to Monroe. Locally heavy rainfall during this period caused flash and urban flooding in several localities. In Franklin Parish about 15 families were evacuated from South Winnesboro on the 10th. Flooding came from Ash Slough and Turkey Creek. Although there are no stations on these streams, water levels were reported to be the second highest since 1927 and the highest since 1953. In Winn Parish nearly 9 inches of rain on the 10th flooded all highways leading into Winnfield, LA, and forced evacuation of more than 30 residences there. In Lincoln Parish, 2.5 inches in several hours on the 12th caused some urban flooding in Ruston.		
Black and Lower Red Rivers (Louisiana)	Flooding continued from May on the Black River ending on the 3d at Acme. Locally heavy rain caused a secondary crest on the 16th at Jonesville Lock and Dam, where flooding ended on the 24th. Flooding continued on the lower Red below Alexandria until the 20th. No reporting stations in this reach. Urban flooding occurred in Natchitoches Parish on the 10th with reports of 13.1 and 10.5 inches of rain in 7 hours at and near Bellwood. A number of streets and highways were closed.	0	N/A
	LOWER MISSISSIPPI BASIN		
Lower Mississippi Basin	Rainfall for June was much above normal for southeast Louisiana with New Orleans recording a total of 14.44 inches for the month. Urban flooding occurred over portions of New Orleans on several occasions. Street flooding with up to 3 feet of water was reported in East New Orleans on the 12th. A ten-year old boy was drowned in a drainage canal. Urban flooding was also reported on the 23d, 24th, and 29th. The Amite River crested 1.3 feet over flood stage on the 11th at Denham Springs, LA.	1	N/A
	WEST GULF OF MEXICO DRAINAGE		
Atchafalaya River Basin (Louisiana)	Monthly rainfall totals were well above normal ranging up to the 13.0 inches reported at Morgan City. The period of heaviest rainfall was the 10th-15th with urban flooding reported at Houma on the 10th and in the Gibson area on the 15th. The Atchafalaya River continued above flood stage the entire month at Morgan City aided by the heavy rainfall. However, no distinct	0	N/A

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	WEST GULF OF MEXICO DRAINAGE-Cont'd		
	crest occurred during June as the stream receded from the flood crest of April.		
Calcasieu River (Louisiana)	Flooding continued at Hineston from the heavy rains of late May, ending on the 4th. The storm of the 10th-15th caused flooding at Hineston with a crest 2 feet over flood stage on the 12th. Monthly rainfall was excessive over the basin ranging up to 11.48 inches at Sugartown.	0	N/A
Sabine River (Texas)	The heavy rains of late May caused minor flooding to begin at Mineola on the 1st and minor flooding continued on the lower Sabine at Bon Weir and Deweyville ending at all points during the first week of June. During the period of the 9th-10th a frontal system lying across Texas from about Del Rio to Texarkana was responsible for heavy rainfall over southern Texas. Amounts of 5 to 10 inches were common over the coastal areas. In the Sabine Basin storm totals ranged up to the 10.55 inches reported at Deweyville. From 1.5 to about 3 feet of flooding occurred along the Emory to Mineola reach and minor flooding at Deweyville.	0	N/A
Neches River Basin (Texas)	Lowland flooding which had been in progress for several months continued throughout June on the Neches River at Diboll and ended on the 27th at Lufkin on the Angelina River tributary. Minor flooding from the heavy rains of late May ended on the 2d at Beaumont. The storm of the 9th-10th caused record flooding along Pine Island Bayou. The crest at Sour Lake of 30.83 feet was the highest since 1917 when a stage of about 31 feet was reached as determined from floodmarks. A stage of 30.5 feet was reached in June 1973. Records began at Sour Lake in 1967. Flood stage there is 25 feet. Storm rainfall totals ranged up to the 17.51 inches reported at Sour Lake. Lumberton reported 12 inches. Extensive flooding was reported along the upper portion of Village Creek although the reporting station at Kountze apparently did not go over flood stage. Extensive damage occurred along Pine Island Bayou from above Sour Lake down to Beaumont where serious flooding also occurred with losses of $4,500,000. All of the inhabitants along Pine Island Bayou were evacuated including the 2,000 residents of Sour Lake. Crop damage of $175,000 was reported in Jefferson County. Eighteen month old twin infants were drowned in a flooded home in Port Arthur.	2	10,175

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JUNE 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	WEST GULF OF MEXICO DRAINAGE-Cont'd		
Trinity River Basin (Texas)	Flooding which began on the lower Trinity in April continued throughout June at Moss Bluff as a result of releases from Lake Livingston which also caused a period of flooding at Liberty. A secondary crest occurred at Moss Bluff on the 10th almost 4 feet over flood stage. This crest resulted from the storm of the 9th-10th which deposited 4 to 6.5 inches of rain over the lower reach of the river. This storm also caused flooding in the headwaters of the Trinity River with crests about 2.5 feet over flood stage at Corsicana and Dallas.	0	N/A
San Jacinto River Basin (Texas)	The storm of the 9th-10th caused serious urban and stream flooding in the Houston area, mainly from Sims Bayou. Deer Park in southeast Houston reported a storm total of 15.52 inches. Damage to homes and businesses in south and east portions of Houston was estimated at $1 million. The Gulf Freeway to Galveston was cut off on the evening of the 9th. No reporting stations went over flood stage.	0	1,000
Guadalupe River Basin (Texas)	Flooding from the heavy rains of late May continued into June, lasting until the 5th at Victoria and the entire month at Dupont. Releases from Canyon Dam helped to maintain high river stages. Rains of 2 to 3 inches occurred in the Gonzales area on the 9th-10th causing a crest 1.7 feet over flood stage at Gonzales.	0	N/A
Nueces River Basin (Texas)	The most significant flooding in the basin during June was a continuation of that which resulted from the heavy rainfall of late May. This flooding ended on the 2d at Calliham on the Frio River and on the 6th to 8th on the lower Nueces. Rains of 1 to 2 inches on the 9th-10th and about an inch late in the month caused some minor flooding at Cotulla and Calallen and prolonged flooding around Tilden until the 25th with a crest 3.5 feet over flood stage there on the 14th.	0	N/A
	GREAT BASIN		
Utah and Colorado Streams	A year that started out slightly below normal made a quick reversal in April to a wet and cold regime which continued through May and into the first part of June. Nevada, Colorado, and particularly the Wasatch Range of Utah were hard hit. Along the Wasatch Range precipitation was well above average in April and up to 400% of average in May. Cool temperatures in April and most of May delayed snowmelt so that snow packs were at record levels for the season when melting began. A very severe threat of extensive flooding existed in the Salt Lake City	1	N/A

GREAT BASIN-Cont'd

area but alternate periods of warming and cooling eased the snow pack melt with the result of only minor flood damage, caused mostly by debris-clogged channels and culverts.

Flooding occurred in southwestern Colorado, at many points in the Wasatch Range of Utah, and along the Humboldt River in Nevada. The heavy snows caused the inflow to Utah Lake in June to be 175,000 acre-feet, which was the highest month of record and 300% of normal. The Great Salt Lake reached 4201.55, which was .20 feet higher than that last year and the highest it has been in 45 years. A discussion of the more significant events follows:

Urban flooding occurred on Main Street in Salt Lake City on the 3d, as a thundershower dumped heavy rains into the streets, where the sewer system was already filled to capacity from snowmelt runoff. High water lapped at the doorsteps of numerous businesses and department stores.

Temperatures finally reached the 90° mark on the 6th resulting in minor snowmelt flooding of Big and Little Cottonwood Creeks and American Fork Creek on the 8th. High flows from these creeks and significant outflows from Utah Lake resulted in flooding along the Jordan River, which caused some pastureland flooding and partial inundation of Meadowbrook Golf Course.

Flooding also occurred below Deer Creek Dam on the 10th and 11th as releases were increased to allow more storage in the event of high inflow peaks. The high flows resulted in flooding of 2 picnic campgrounds and sandbagging along several residences in the canyon.

On the 15th to the 17th, additional minor flooding along Big and Little Cottonwoods as a lower secondary snowmelt peak continued to present problems to residences in lower areas of the stream channels. Sandbagging and heavy equipment was used to prevent significant damages.

On the 19th, Mill Creek in Salt Lake City flooded in vicinity of 5th East as a result of rains on a stream virtually bankfull as a result of snowmelt.

On the 21st, a flash flood occurred on Burch Creek near Riverdale, UT. The flooding occurred during the night as 1.3 inches of rain fell. Much of the damage resulted from the replacement of a 20 foot culvert by 2, 2-feet diameter culverts thus damming up water.

Clemson University Library

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JUNE 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	GREAT BASIN-Cont'd		
	Homes were flooded, a sewer line was washed out, and some damage to acreage occurred. Actual damage estimates were not available but probably approached $10,000. One death occurred when a car was driven into a flooding stream, drowning the driver.		
Humboldt River	Flooding of lowlying agricultural land occurred along the Humboldt River as a result of the excessive snowmelt runoff.	0	N/A
	PACIFIC SLOPE DRAINAGE		
Upper Columbia River Basin	A record flood crest of 13.93 feet occurred on the Clark Fork River above Missoula, MT, on the 21st. The previous record was 13.35 feet in 1964. Flood stage there is 11 feet. As in 1964 the flooding was due to heavy rains which crossed the Continental Divide from the headwaters of the Missouri River where flooding also occurred as previously discussed. These rains came near the end of the snowmelt runoff with streams still high. Some residential damage occurred in the Missoula area. Two families were evacuated upstream at Drummond, MT, and a section of the Milwaukee Railroad mainline was washed out. Some homes were flooded at Elliston, MT, on the Little Blackfoot River. Flooding also occurred in the Flathead River Basin, but was apparently well below the record flood of 1964, although the gage on the Middle Fork of the Flathead River at West Glacier, MT, was washed out and flood data is not currently available. A section of the Burlington Northern Railroad's mainline was washed out. Glacier National Park and U.S. Hwy. 2 were closed for several days. A crest nearly 4 feet over flood stage occurred on the Flathead River at Columbia Falls, MT. Many trailer homes located on the flood plain were moved before flooding occurred.	0	N/A
	ALASKA		
Yukon River Basin	The lower Yukon River remained over bankfull at Russian Mission for the first 26 days of the month due to high snowmelt runoff and to the draining off of the huge lake impounded by the Holy Cross ice jam in May. In the headwaters of the Yukon, unusually low stages were noted on the Chatanika River. No stage records are available for comparative purposes.	0	N/A
	PUERTO RICO		
	June rainfall averaged about 50% of the normal for the month as drought conditions continued to intensify over most of the island. Several areas along the southern coast and slopes	1	N/A

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	PUERTO RICO-Cont'd		
	received no rain and many zones averaged less than .05 for the period. Agricultural drought reached serious proportions along both the southern and northern coasts where emergency aid was provided for cattle farmers whose pastures have been destroyed. Some water rationing started in towns along the southeast coast although most reservoirs on the island are still near capacity. Several days of heavy showers over the central portions of the island were reported the middle of the month with amounts totaling 2 to 5 inches. No stream flooding was reported although rivers in the area of Ponce were swollen for several days. One death occurred when a man drowned trying to cross a river near Ponce. Minor street flooding and some local ponding in the low lying areas of Ponce were reported due to poor drainage conditions, otherwise no significant flooding occurred.

NO DATA RECEIVED

TOTAL OZONE DATA

[illegible] provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the same [illegible] August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA"

[illegible]

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS LATE REPORTS

MARCH 1975

Basins and Streams	FLOOD EVENT PACIFIC SLOPE DRAINAGE	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
Southern California Coastal Streams	The following is a delayed report on severe flooding which occurred in March 1975 in the Eel River Basin. Minor flooding occurred along the Smith River. A moderate surface storm moved west across the northern Pacific and was centered in Gulf of Alaska with a closed low aloft following on March 17. A sharp, vigorous, surface wave formed at about the peak of the warm sector just west of the Northern California Coast during the morning of March 18. The beginning rain about mid-day on the 17th was 0.1 inch per hour or less with greatest amounts over the Smith River Basin. Rain in the amount of 0.2 inch per hour began to fall over the three river basins early on the 18th. By morning heavy rain in amounts of 0.3 to 0.5 inch per hour was falling over much of the North Coast. High totals for the storm reached 10 inches or more over each river basin. Most of this was run-off since soils were already saturated from previous rains. The Smith River crested 1.7 feet over flood stage at Crescent City and 0.8 feet over flood stage at Dr. Fine Bridge. Most of the damage occurred in Humboldt County in the Eel River Basin where the Van Duzen River crested 0.4 feet over flood stage at Bridgeville and the Eel River 1.9 feet over flood stage at Fernbridge. Of the total damage about $1.5 million was to state highways and county roads from slides and slipouts. Savings from timely warnings were estimated to be $3 million. More than 1,000 head of livestock and many families were evacuated. No losses of people or animals were reported. Redwood Creek and the Mad River both exceeded warning stage at Orick and Arcata, respectively.	0	1,840

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	PACIFIC SLOPE DRAINAGE		
Snake River Basin	Snowmelt flooding began in April on the Boise River and in May on the Portneuf and Henry's Fork of the Snake River. The Boise River, a regulated stream, was increased in flow by the combined decision of the Corps of Engineers, The Boise Board of Control and the Bureau of Reclamation. The snow survey on April 1st showed a snow pack of 128% above normal, indicating that additional storage was necessary for control of the expected runoff. The flow was increased beyond the flood stage of 7 feet on April 5th and continued above flood stage through April and May. The flow at Boise was held near 7.26 feet during that period, with variations between 7.10 feet and 7.34 feet. Flooding ended on June 2. About 2,000 acres of pasture and hayland were inundated. Some damage to farm buildings, roads and bridges also occurred with losses estimated at $30,000. The Portneuf River at Pocatello went above flood stage of 8 feet on May 16th and remained above flood stage through the end of May. The highest stage attained during May was 9.39 feet on May 20th. Damage was reported as minor from water overflowing onto pasture and farmland. Such flooding during the spring runoff is almost routine on this reach of the Portneuf. Two farmhouses near Inkim were evacuated for a few days but damage at those residences was minor. The Henry's Fork of the Snake River fluctuated around the flood stage of 9 feet during the latter part of May and most of June. The major period of flooding was May 31 to June 13 during which the high stage for the season of 10.21 feet was reached on the 5th. The period of high temperatures May 14-19 resulted in rapid snowmelt and flooding on a number of small streams from which no stage reports are received. The most serious threat posed by this flow was at Oakley Reservoir on Goose Creek (Cassia County). The reservoir has overflowed only once previously, and that was in 1921. The May 1975 episode resulted when inflow from snowmelt exceeded the outflow that could be diverted through canals, and the reservoir approached the spillway level. There is no longer a streambed downstream from the spillway, and extensive damage could have resulted from a significant overflow from the spillway. Cool weather beginning on May 20th reduced the inflow and the flood threat. Thus the rise of the lake level crested below the spillway level and there was no flooding or damage. Elsewhere, several creeks experienced flooding in Twin Falls County and Cassia County as the high temperatures affected the heavy snowpack. Most notable were Rock Creek above Kimberly and Dry	0	N.A.

PACIFIC SLOPE DRAINAGE-Cont'd

Creek above Murtaugh. Along these streams there was flooding over roads, pastures, and hay fields. Although no publicly owned bridges were damaged, at least seven private roadway bridges on Rock Creek were washed out.

In Bonneville County, Willow Creek and Sand Creek went over their banks during the hot weather but damage was apparently very minor. Although there is considerable potential for damage along these creeks, this turned out to be a minor episode.

Beaver Creek in Dubois (Clark County) was reported by the local watermaster as having crested at about 4 a.m. on May 18th when it reached a gage height of 7.22 feet with an approximate flow of 900 cubic feet per second. Watermaster Don Shelton believes this may be a record as he has found no record of higher readings. The principal damage was erosion of highway and railroad embankments, and over two miles of fence along Interstate Highway 15 were washed out just south of Dubois.

Mud Lake posed a significant flood threat in Jefferson County, if the heat wave had persisted longer, but the cool weather resumed in time to end the threat. Flooding along several of these streams lasted until mid-June. Most notable of which was that along Rock and Dry Creeks.

REFERENCE NOTES

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES   Dates in the table apply to the period 24 hours prior to time of observation. In some cases the actual occurrence is on the calendar date preceding that shown. (See individual Climatological Data for times of observations).

+	And also on an earlier date or dates
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch of water equivalent to every 10 inches of snowfall.

CLIMATOLOGICAL DATA - METRIC UNITS: Data from airport unless otherwise specified.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile data can be evaluated.

B	Number of days maximum 21.1°C. or above for Alaskan Stations.
Y	Peak Gust.
+	And also on an earlier date or dates.
U	Indicates Urban site.
R	Indicates Rural site.
Ø	Station pressures apply to elevations shown in the "Elevations" table of the annual issue of this publication.

Conversion formulae to English Units are as follows:

1 foot = 0.3048 meters
F. = $\frac{9}{5}$ x C + 32
1 inch = 25.4 millimeters
1 mile per hour = 0.447 meters per second

HEATING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

COOLING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

STORM SUMMARY:

°	Includes crop damage.
C	Crop damage.
*	No occurrence of storms or unusual weather phenomena reported.
@	Includes heavy sleet storm.
#	Freezing drizzle and freezing rain, commonly known as glaze.
Ø	For breakdown of "All Others," and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
‡	No Storm Data Report received for this State.
<>	Report Incomplete.
†	Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5 Million
7	$5 Million to $50 Million
8	$50 Million to $500 Million
9	$500 Million to $5 Billion.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS:

!	Unknown

RAWINSONDE DATA (Average Monthly Values):

All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon. The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors. These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

*	Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.
+	Observations for these stations are scheduled at 0000 G.C.T.
†	Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES: Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

()	Clouds Present	DM	Moderate Dust	HM	Moderate Haze	KS	Slight Smoke
*	Values corresponding to true solar noon	DS	Slight Dust	HS	Slight Haze	M	Moderate Haze-indeterminable
BD	Blowing Dust	F	Fog	I	Intense Haze-indeterminable	N	Sand
BN	Blowing Sand	GF	Ground Fog	K	Smoke	S	Slight Haze-indeterminable
D	Dust	H	Haze	KI	Intense Smoke		
DI	Intense Dust	HI	Intense Haze	KM	Moderate Smoke		

NET RADIATION: The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA: These data are from an U-V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA: The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded $\Omega\ \Omega\ \Omega$) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code $_{\lambda}$s designates the type of measurement made.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

JULY 1975

GENERAL SUMMARY OF WEATHER CONDITIONS

Dr. Richard E. Felch, Climatologist

HIGHLIGHTS: Extreme dryness or wetness in July was the rule rather than the exception. The central and northern Great Plains and the western Corn Belt were unusually dry and warm. The southern Great Plains, Southeast, and Atlantic Coast States had well above normal percipitation and below normal temperatures.

Del Rio, Texas, had its wettest July on record with 8.26 inches of rainfall, 7.24 above normal. Glasgow, Montana, received 4.18 inches for its second wettest July on record. Des Moines, Iowa, with 0.04 inch, had its driest July, and Minneapolis-St. Paul, with 0.58 inch, the driest since 1937. Wichita, Kansas, broke last year's record low July rainfall of 0.09 inch, with only 0.05 inch this July.

PRECIPITATION: The month began with serious flooding in the Red River Valley of the North, and rains continued into early July. A flash flood roared through Las Vegas, Nevada, on the 3d, causing the death of two people and an estimated million dollars in property damage. Warm, muggy weather dominated most of the northern and central States.

Rain fell nearly everywhere in the United States in the second week of July, but heaviest amounts fell along the East Coast and in the Gulf Coast States. Unusual thunderstorm activity also occurred in the Pacific Northwest. Heavy storms developed in many of the Atlantic and Gulf Coast States on the 7th and 8th. Northeast Louisiana had a record rainfall of more than 10 inches within 12 hours. The storm system moved slowly and later in the week brought violent weather to the Atlantic Coast. Flash floods were reported from North Carolina to New England.

Heavy rain continued along the Atlantic Coast into the third week. Parts of central New Jersey received 4 to 5 inches in less than 6 hours. Record flooding occurred throughout the Trenton, New Jersey, area, where the Millstone River rose to a record 8 feet above flood stage.

Precipitation was focused mainly on the Southeast during the fourth week. Violent storms lashed the Central Plains and middle Mississippi Valley. Illinois suffered the greatest damage when 85 mph winds struck Peoria and a tornado at Canton took five lives.

At the end of the month, a tropical depression dumped heavy rains along the Gulf Coast, covering parts of Florida, Georgia, Alabama, Mississippi, and Louisiana. These areas received more than 12 inches over the entire month.

TEMPERATURE: The northern half of the Nation was generally warmer than normal in July, while the Southern States averaged below normal readings.

Average temperatures during the first week of July showed most of the Nation to be above normal. California, Texas, Oklahoma, Louisiana, and the East Coast from New England to Georgia were below normal.

Most of the Nation east of the Continental Divide cooled to well below normal temperatures during the second week. Record low temperatures were set on the 13th in many parts of the Midwest: Rochester, Minn., 43°; Peoria, Ill., 48°; and Waco, Tex., 63°. West of the Divide, however, Walla Walla, Wash., climbed to 114° on the 10th.

As the month closed, temperatures were above normal over most of the Country.

Clemson University

TROPICAL STORM AMY

JUNE 27 - JULY 4, 1975

National Hurricane Center, NOAA
Miami, Florida

During the period June 24th-26th a weak surface trough of low pressure persisted over Florida and the adjacent Atlantic waters. A weak circulation formed off the Florida east coast just north of the Bahamas by the evening of the 26th. The tropical depression moved northward about 10 mph during the 27th with the lowest pressure around 1012 mb and the highest winds of 25 to 30 mph. The development of a well organized warm anticyclone in the upper atmosphere during the early stages of this system contributed to its rather rapid strengthening into a tropical storm on the 28th and 29th. The storm skirted the North Carolina coast, and the area of maximum winds and heaviest rainfall remained over the open waters of the Atlantic.

From the 29th to July 3d Amy moved on a meandering east-northeast course with an average forward speed of less than 10 mph. On both July 1st and 2d, minor troughs in the westerlies caused Amy to slow and turn to a more northerly course with brief threats to the Canadian Maritime Provinces. On the 3d, a major trough developing over southeastern Canada produced a rapid northeasterly acceleration with the center of Amy passing some 150 miles southeast of Cape Race, Newfoundland, on the 4th. The high winds and rains associated with the storm did not affect Newfoundland. The system gradually lost all its tropical characteristics over the cold waters of the far north Atlantic after passing Newfoundland.

Damage produced by Tropical Storm Amy was light and confined to erosion along the outer banks of North Carolina. Tides of 2 to 4 feet above normal caused by prolonged northeasterly winds, combined with large swells associated with the circulation of Amy, damaged many of the beaches. Some state highways near the beach were temporarily under water. Rainfall of 2 to 4 inches occurred along the immediate coast of North Carolina but was much lighter inland.

During most of its life Amy had many of the characteristics of a subtropical storm. The region of maximum winds was well removed from the center and midtropospheric temperatures were not as warm as might be expected in a tropical storm. The minimum pressure was 981 mb, but the maximum sustained winds of 70 mph were less than might be expected with this pressure. However, when the low attained winds of gale force, data indicated it was more tropical than subtropical, so it was named Amy. Because of the close proximity of the coast the name was retained throughout to avoid confusion in public releases.

HURRICANE BLANCHE

JULY 24 - JULY 28, 1975

National Hurricane Center, NOAA
Miami, Florida

Blanche, the season's first hurricane, had its beginnings as a tropical wave which moved off the coast of Africa on July 14. As the wave entered the Caribbean region, it appeared to elongate and then divide into two systems. One part tracked northwestward as a cloud mass from which a depression formed about 500 miles north of the eastern tip of the Dominican Republic on the 24th. The southern part continued westward across the Caribbean Sea and the Yucatan Peninsula, and formed a tropical depression in the southwestern Gulf of Mexico on the 25th.

The first depression gradually turned toward the north and north northeast during the next two days. In this interval reconnaissance and satellite data indicated that it hovered on the brink of becoming a tropical storm. The threshold was probably crossed during the early hours of the 26th, when a reconnaissance aircraft found a central pressure of 1004 mbs. This point marks the beginning of Tropical Storm Blanche on the official track. Meanwhile, the second depression intensified as it crossed the southwestern Gulf of Mexico, and was on the verge of becoming a tropical storm when it passed over Tampico, Mexico, later the same day.

As Blanche turned toward the northeast, its potential for further intensification was dependent upon the impact of an approaching cold front moving off the North Carolina coast. However, the front rapidly weakened before cooler air could penetrate the storm's inner core, and Blanche steadily deepened, partly in response to the baroclinic effect of an upper trough to the west. Blanche reached hurricane strength as the central pressure fell to 987 mbs during the early hours of the 27th. At this time the hurricane was at the same location crossed by Tropical Storm Amy two weeks earlier.

Whereas Amy followed a meandering track toward the northeast, Blanche moved north northeastward toward Nova Scotia. As a deepening upper trough moved through eastern Canada, Blanche accelerated to a forward speed of about 30 mph at the time of landfall at Cape Sable, Nova Scotia, about daybreak on the 28th.

During the twelve hours prior to landfall the hurricane reached its maximum intensity. Highest sustained winds were about 85 mph and the lowest pressure was 980 mbs. In view of the strengthening and acceleration, gale warnings were issued for the eastern portion of the Maine coast, from Rockland to Eastport at midnight on the 27th. Meanwhile, the Canadian Weather Service issued a hurricane warning for Nova Scotia.

The lowest pressures at land stations were 987.0 mbs at Western Head, near Cape Sable, at 1330 GMT following a 3-hour pressure fall of 16 mbs; and 988.7 mbs at nearby Shelburne at 1200 GMT after a 3-hour fall of 18 mbs. Some maximum wind measurements on the 28th are: Halifax, sustained winds of 52 mph with gusts to 80 mph at 1422 GMT; Western Head, sustained winds of 54 mph at 1200 GMT; and Gridstone Island, sustained winds of 70 mph at 1800 GMT.

There was no loss of life due to Blanche. Considerable minor damage occurred, mostly in eastern Nova Scotia, consisting mainly of small boats washed ashore, and trees blown down. Rainfall was not excessive. The greatest accumulation was 3.1 inches in Chatham, New Brunswick. The rains proved beneficial, bringing an end to a prolonged dry period over the region.

HURRICANE BLANCHE

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JULY 1975

Herbert J. Thompson, Office of Hydrology

The major flooding which began in June in the Red River of the North Basin reached its climax during July with record crests at eleven reporting stations. It was one of the most damaging floods ever to strike this area with damage in excess of $273 million. Major flooding occurred in New Jersey with damage of $85 million, and minor to serious flooding was reported along several Atlantic Coastal streams in the Southeastern States.

Significant flooding occurred in some portions of the Missouri Basin, in contrast to record low monthly rainfall totals in some other areas of the Basin. Record runoff in the upper portion of the Basin caused some main stem reservoirs to reach record high levels. Significant flooding also occurred in portions of the West Gulf of Mexico Drainage in Texas.

A major flash flood event occurred at Las Vegas, NV, with two lives lost and $6 million in damage. A number of other flash flood events were reported with extensive damage occurring in Arizona and the Snake River Basin of Idaho and Oregon. A record 12-hour rainfall at Monroe, LA, caused major urban flooding in that area.

These and other hydrologic events of unusual significance or involving loss of life or property are discussed in more detail below.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	HUDSON BAY DRAINAGE		
Souris River Basin (North Dakota)	The flooding which began in April ended during July after reaching record stages around Minot during May. July rainfall amounts of 2.5 to 4 inches helped to prolong flooding along the lower Souris until the 16th.	0	N.A.
Red River of the North Basin	One of the most damaging floods ever to strike this area occurred during July as a result of the storm of June 27 to July 1 discussed in the June report. Additional rains of 1 to 3 inches on the 4th to 5th over a portion of the basin augmented the flooding at some downstream points and made upward revisions in forecasts necessary. On the tributary streams in the upper portion of the basin flooding began late in June but crests generally occurred in July and ranged up to the 15 feet over flood stage reported on the Buffalo River at Dilworth, MN, and the Wild Rice River at Hendrum, MN. Both were record crests. In the lower portion of the basin and on the main stem of the Red River flooding generally began early in July, and lasted most of the month on the lower Red River. Flooding was somewhat less severe in the lower portion of the basin although a record crest, 11 feet over flood stage, occurred on the South Fork of the Two Rivers at Lake Branson State Park, MN. Crests on the Red River ranged up to the 14.5 feet over flood stage reported at Halstad, MN - a record crest at this point. During this flood record crests occurred at 11 reporting stations as indicated in the flood data section. Most of the previous record stages occurred during the snowmelt flood of 1969. The 1975 flood was unique in that it was caused entirely by rainfall. Most floods in this basin result at least partly from snowmelt runoff. Preliminary results from Red Cross surveys indicate that 2,380 families suffered losses during this flood, with 7 homes and 33 mobile homes destroyed. Major damage occurred to 165 homes and 229 mobile homes and minor damage to 1,917 homes. Four deaths and seven injuries were attributable to the flooding.	4	273,434

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JULY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)

HUDSON BAY DRAINAGE-Cont'd

A total of 2,369,370 acres were flooded. Monetary damages reported by the Corps of Engineers are tabulated below by river basin. By far the most seriously affected was the Sheyenne River Basin in North Dakota.

Damage in Thousands of Dollars

ATLANTIC SLOPE DRAINAGE

Hudson River Basin	Two periods of flooding occurred along Wappingers Creek during July. Rainfall of at least 3 to 4 inches over the lower Hudson River basin on the 13th-14th and again on the 20th-21st caused crests 2.6 and 3.3 feet respectively over flood stage.	0	N.A.
Lower Delaware River Basin and New Jersey Coastal Drainage	Two periods of extremely heavy rainfall over central New Jersey during July caused record flooding in the area. During the period of the 13th-15th, a stationary front lying north-south through central Pennsylvania and a large high pressure area off the New England coast caused slow-moving thunderstorms over the area in the moist tropical air. Heaviest rainfall was in the Mercer-Somerset County areas of	5	85,000

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	central New Jersey. The second highest stage of record occurred at Blackwells Mills on the Millstone River with mass evacuations in the area. Heavy rains caused extensive areas of farmland to flood with high crop loss. There were 6 flood deaths in New Jersey and 1 each in Pennsylvania and Delaware. Damage was considered minor in Pennsylvania but in New Jersey the damage was estimated at $55.7 million. Storm rainfall totals ranged up to nearly 12 inches with a number of reports in excess of 10 inches. The crest at Blackwells Mills was nearly 10 feet over flood stage and about 2 feet below the record stage of August 1971 which resulted from tropical storm Doria. From 3 to 4.5 feet of flooding was reported along the Raritan River in New Jersey and up to 3 feet of flooding occurred on Neshaminy, Perkiomen, and Brandywine Creeks in Pennsylvania. On the night of the 20th-21st a slow moving cold front set off numerous showers and thundershowers which again hit the Mercer-Somerset County area. Rains of up to 7 inches in 12 hours over already saturated soil caused record flooding along the whole length of the Assumpink Creek in Mercer County. Evacuation of 1200-1500 families was necessary in the city of Trenton. Flood waters halted all rail service along the Penn Central tracks for 24 hours, cancelling more than 100 commuter and long distance trains. Also closed due to flood water were large portions of U. S. Highways 1 and 130 in the Trenton area. Damage was confined mostly to the Trenton area with estimates of $25-30 million. There were no deaths. The crest at Trenton, 7.6 feet over flood stage, was more than a foot over the previous record stage of August 1971. Monthly rainfall totals in Mercer and Somerset Counties ranged from 13.39 inches at Trenton to 18.98 at Princeton and 19.65 inches at Blackwells Mills.		
Delaware and Maryland Streams	Moderate to severe river and flash flooding occurred in this bi-state area as a result of several intense thunderstorms during the period of the 10th-20th. On the afternoon of the 10th a small section of southeast Baltimore was inundated with damage estimated in excess of $1 million. Damage of $200,000 was reported in Montgomery County, MD, on the 15th. The U. S. Geological Survey reported record or near record crest stages on some smaller tributaries of the Nanticoke and Anacostia Rivers. Peak flows were of a 25 to 50 year frequency. A record stage occurred on Silver Lake in Dover, DE, and on the St. Jones River.	3	N.A.
James River Basin (Virginia)	The lower James Basin received above normal rainfall during July. Many stations reported monthly totals in excess of 10 inches. Richmond received 12.29 inches, more than twice normal. Heaviest rainfall occurred on the 11th-16th with storm totals of 5 to 8 inches common. About 2 feet of flooding occurred on the upper Appomattox River and the	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JULY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ATLANTIC SLOPE DRAINAGE-Cont'd		
	James River went slightly over flood stage at Richmond.		
Chowan, Roanoke, Tar, Neuse and Cape Fear River Basins	The highest stages for the year thus far occurred during July at a number of stations. Rainfall was well above normal. General rains of 0.5 to 1.5 inches occurred over eastern North Carolina on the 4th-5th with an isolated amount of 3.0 inches at McCullen, NC. Between the 9th and 12th amounts of 1.5 to 2.5 inches fell over the central and northeast portions of the state. Flooding began on the 14th with heavy rainfall of 2.5 to over 6 inches. On the Tar River crests ranged from about 2 to nearly 8 feet over flood stage. From 5 to 9 feet of flooding occurred along the Neuse River, and crests 10 to 17 feet over flood stage occurred on the middle reach of the Cape Fear River from Fayetteville to Elizabethtown, NC. Serious flooding was reported by the Corps of Engineers on the Nottoway and Meherrin Rivers in the Chowan Basin with 3 lives lost and $5 million in damage.	3	10,000
Coastal Basins in South Carolina and Georgia	Monthly rainfall amounts were generally much above normal during July, totaling more than 14 inches over some of the headwater areas. Heaviest rainfall occurred during the middle of the month with storm totals of as much as 9 to 11 inches over some areas. The most serious flooding occurred in the Pee Dee River Basin where tributary crests ranged up to 4 feet over flood stage and main stem crests from 6 to 8.5 feet over flood stage. Losses were estimated at $120,000 while savings from warnings were $150,000. On the lower Broad River a crest 3.3 feet over flood stage was reported at Blair, SC and losses were estimated at $7,000 with savings of $50,000. Extensive lowland flooding on the Congaree River below Columbia caused losses estimated at $10,000 with savings of $100,000. Lowland flooding also occurred on the lower Santee and lower Wateree with negligible losses and substantial savings from warnings. No stage reports are received from these areas but removal of cattle and equipment result in significant monetary savings. Total savings from flood warnings were estimated at $1,060,000 for these basins. Minor flooding occurred in the Edisto River Basin in South Carolina and on the lower Savannah River and portions of the Ogeechee River in Georgia.	0	137
	EAST GULF OF MEXICO DRAINAGE		
Gulf Coast Streams in the Florida Panhandle	A tropical depression which moved over land from the Gulf of Mexico near Gulfport, MS, produced widespread flooding throughout northwest Florida and into southern portions of Alabama. Heaviest rains totaling from 6 to 16 inches and falling from July 29th through August 1st affected a wide area eastward from coastal sections near Apalachicola, FL,	0	N.A.

Clemson University Library

EAST GULF OF MEXICO DRAINAGE-Cont'd

across the Florida panhandle into south-central and southwestern Alabama. To the west amounts just exceeded 10 inches in the Mobile area before becoming substantially lighter through southern Mississippi. Northward, the heaviest precipitation penetrated into the lower tier of counties across southern Alabama. At Brewton, AL, which was hard hit by flooding in April, a total of almost 16 inches of rain was recorded during the 4-day period. Eight to 12 inch amounts were commonly spread from the lower Choctawhatchee Basin westward into Southwest Alabama.

In comparison to the rains and resulting floods of past April, these rains although of similar amount, extended over a much longer period of time. Rains also affected an area displaced farther south and westward than the earlier storm. The greatest problem from flooding was centered over the toe of the Florida panhandle and northward into Escambia County, AL, with the axis of heaviest accumulation having a north-south orientation.

Flood damages were highest again along Murder Creek in Brewton, AL, where authorities estimated up to $300,000 in public and private property loss. Fifty persons were evacuated in preparation for the rising flood with the crest of 16.7 feet arriving during the early morning of August 1st. As the crest arrived several businesses in East Brewton were flooded with water reaching depths of 3 to 4 feet. In the City of Brewton, about 10 buildings and homes were flooded to lesser depths. With a crest just 3 feet shy of the April peak, neither this flood nor the April flood has been equalled or exceeded since March 1929.

Just to the west of Brewton at Flomaton, AL, on the Big Escambia Creek, a crest of 15.2 feet on August 1st, lacked about one and half feet reaching the April flood height.

The Choctawhatchee River at Geneva, AL, rose to a crest of 26.04 feet on August 3. Precautions were taken to evacuate 10 families along Old Westville Road outside the levee's protection. Waters did not rise to a height which caused property damage although some low-lying roads were temporarily underwater as the crest arrived.

In northwest Florida many rivers and creeks remained out of their banks for several days with well above normal flows apparent at many downstream points continuing into mid-August. Significant flooding occurred along almost all drainages west of the Apalachicola River although total property damage fell well short of the April figures. Rivers and creeks such as the Yellow, Shoal, Alaqua, Blackwater, Coldwater, Escambia, and Perdido experienced the heaviest runoff. Flooding at some points along smaller rivers and creeks approached or exceeded all time record heights. The Alaqua Creek crested 3

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	EAST GULF OF MEXICO DRAINAGE-Cont'd		
	feet above any previously recorded height at 21.35 feet, midnight, July 31. In many cases forecasts were being provided for areas in northwest Florida not considered official forecast points and for which river gages were unavailable for reports or for the public to relate to.		
	Evacuations were required in the Crestview, FL, area when a small dam west of the city failed. No loss of life or property damage occurred although additional discharge into the lower Yellow River below Milligan did cause some flood damage to fishing camps and mobile homes downstream. A record crest occurred on the Shoal River near Crestview. Along the Blackwater River at Milton, FL, water rose to depths of 2 feet in portions of the downtown area and some campgrounds near the city were flooded.		
	July rainfall has established this as an exceedingly wet year for southern Alabama. By the first week in August several stations in south-central Alabama already were within a few inches of their maximum annual precipitation records.		
Coosa River Basin	On the night of the 6th-7th locally heavy rains of up to 6 inches caused flash flooding of rural roads in the vicinity of Anniston, AL, and caused two families to evacuate their homes.	0	N.A.
	UPPER MISSISSIPPI BASIN		
Crow, Whitewater and Zumbro River Basins	Serious flooding occurred along the Whitewater River in Winona County and the Zumbro River in Wabasha County of Minnesota during the early morning of the 5th. A narrow band of heavy thunderstorms lay from Red Wing, MN to near Winona, MN, for 5 hours. Rain totalled 6 inches at Millville; Elgin totalled 3.26; and Whitewater State Park 3.24. Other unofficial reports showed amounts in excess of 4 inches.	0	469
	Hardest hit was Elba, MN (for the second year in a row). A dike between Elba and nearby Whitewater State Park broke in four places sending six to seven feet of water through Elba. Damage to this area of northwestern Winona County totalled $469,000. Warnings provided time to evacuate 1400 holiday campers at Whitewater and Spring Creek Parks without death or injury. Resultant savings were put at $500,000. No reporting stations went over flood stage.		
	Minor flooding ended along the South Fork of the Crow River in east Central Minnesota as the river returned its banks on the 2d.		
	Between June 28 and July 2 heavy rains of near 7.5 inches at Bemidji, MN, to near 3 inches at Ft. Ripley, MN, in the Mississippi Headwaters produced near flood stage levels at Aitkin on the 4th and Ft. Rip-

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	UPPER MISSISSIPPI BASIN-Cont'd		
	ley on the 6th.		
Skunk River Basin (Iowa)	The major flooding along the South Skunk River continued from June at Oskaloosa ending on July 4. A crest 4.5 feet over flood stage occurred there on the 2d. See the June report for details and estimates of damage.		See June report for lives lost and damage.
	MISSOURI BASIN		
Yellowstone River Basin	Peak flow from snowmelt occurred about 10 days later than normal and probably resulted from 1 to 2 inches of rain during the first week of July. While the crests were not unusually high, generally less than a foot over flood stage, the duration of the period above flood stage was unusually long. As a result there was much greater than normal soil loss from bank erosion. Pasture and cropland was destroyed as streams cut new channels. Some cropland was also flooded. Besides the main stem of the Yellowstone, the Boulder, Stillwater, and Clarks Fork tributaries also flooded. Several farmers reported loss of 5 to 10 acres of land. Losses were in excess of $100, 000. No significant damage occurred in urban areas.	0	100
James River	The flooding which began in May at Columbia and Stratford, SD continued through July with a second crest caused by the heavy rains of late June over the headwaters. The crests at Columbia and Stratford were higher than those of June and were 4.4 and 2.5 feet over flood stage, respectively.	0	N.A.
Plate River Basin	Several locally heavy thunderstorms caused flash or urban flooding in the headwaters of the South Platte River. Two of these were in the Denver, CO, area and one at Fort Collins, CO, with basement and street flooding. Other events of the nature occurred in rural areas. No details are available. On the 22d and 23d bankfull stages were reported along the length of the Wood River from rainfall discussed below. Lowland flooding occurred on Union Creek southwest of Madison, NE.	0	N.A.
Kansas River Basin	Heavy rains over central and south central Nebraska on the 22d caused flooding in the Little Blue River Basin. Amounts of 4.5 inches were reported near Holstein and 4.4 inches at Fairfield. A crest 3 feet over flood stage occurred at Deweese, NE. Flooding was reported in and around Hastings, NE, with roads including U. S. Highway 6 covered. The Union Pacific tracks were under water near Carlton. On the 30th and 31st heavy thundershowers produced rain which averaged 2.5 to 3 inches over the Sappa and Prairie Dog Creek Basins. Flooding was reported on Sappa Creek above Oberlin. This was the driest July of record at many stations in Kansas with records dating prior to 1900. Kansas	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JULY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	MISSOURI BASIN-Cont'd		
	City, MO, received only 0.25 inch of rain, which was the lowest July total since records began in 1888. The previous low July rainfall occurred in 1936.		
Missouri River Main Stem	Record May-July runoff occurred above the upstream reservoirs. Above Fort Peck Reservoir, runoff for the three-month period was 234 percent of normal, while above Garrison Reservoir in North Dakota runoff was 188 percent of normal and was 2.5 million acre-feet greater than any previously recorded since records began in the late 1800's. Storage behind the six reservoirs peaked out at a record-breaking 72,100,000 acre-feet on July 23 with record pool elevations in three of the reservoirs. At the time of peak storage there was still 2.5 million acre-feet of vacant flood control space in reserve. The record pool elevation in Garrison Reservoir caused a crest 4.8 feet over flood stage at Williston, ND, which is in the pool. Lowland flooding occurred in the vicinity of Williston but the town itself is protected by levees. High reservoir releases were necessary to maintain some flood control storage resulting in considerable lowland flooding, bank erosion, and land losses below Garrison, Fort Randall, and Gavins Point Dams. In Knox County, Nebraska, 400 acres of crops were flooded. The 60,000 c.f.s. discharge from Gavins Point were the highest controlled releases on record for that structure.	0	N.A.
	OHIO BASIN		
Ohio River Basin	Precipitation was generally well below normal over the upper portion of the basin in Pennsylvania, West Virginia, and eastern Ohio. In the lower portion of the basin about 3 inches of rain on the 19th-20th caused light flooding on the lower Embarras and the Little Miami Rivers. Serious flash flooding struck Fulton, KY, and South Fulton, TN, for the third time since March. More than 6 inches of rain fell over that area.		
	ARKANSAS BASIN		
Arkansas River Headwaters	Flash flooding from Sand Creek and urban flooding occurred in Colorado Springs, CO, on the 23d. This was caused by one to two inches of rain in about two hours.	0	N.A.
Lower Canadian River Basin	July rainfall totals averaged about 1.5 inches above normal with amounts of 3 to 6 inches on the 24th and 3 inches additional on the 30th. However, the only river flooding reported was on the Little River which crested 0.4 foot over flood stage at Tecumseh, OK, on the 25th. Urban flooding was reported in Oklahoma City on the 26th.	0	N.A.

Clemson University Library

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JULY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	RED BASIN		
Upper Red River Basin	July rainfall totals for southwest Oklahoma averaged 3.5 inches above normal with heaviest amounts of 4 to 6 inches on the 24th. Flooding occurred on the North Fork of the Red which crested 2.4 feet over flood stage at Headrick, OK, and on the upper Washita where a crest 3.3 feet over flood stage was reported at Carnegie, OK.	0	N.A.
Lower Red River Basin (Louisiana)	Record-breaking rainfall produced major urban flooding at Monroe on the 8th. During the 12 hour period from 9 p.m. on the 7th to 9 a.m. on the 8th rainfall exceeded 10 inches in some portions of Monroe with an unofficial report of 12.02 inches in northwest Monroe. Any amount over 8 inches would be a record 12-hour rainfall for the city. Several hundred homes and most streets and highways were flooded. Hundreds of motorists were stalled. The quarters of State Police Troop "F" were flooded. There were no deaths or injuries reported. This storm left rainfall of 4 to 5 inches over much of northwestern Louisiana. Urban flooding was also reported in the communities of Homer and Coushatta, and in Union Parish.	0	N.A.
	WEST GULF OF MEXICO DRAINAGE		
Atchafalaya River Basin	The flooding which began in February at Morgan City ended on July 4. On the 9th rainfall of 4 inches in 2 hours caused urban flooding in the Morgan City area. July rainfall totaled 17.59 inches at Morgan City where more than 45 inches fell during the three month May-July period.	0	N.A.
Trinity River Basin (Texas)	Heavy rains over the upper Trinity River Basin on the 25th-26th caused considerable flooding of tributaries in Dallas and Tarrant Counties. The drought-breaking storm dumped 8 inches on De Soto, a suburb of Dallas. The only major flooding was on the Little Fossil Creek where 26 homes had up to 3 feet of water in them. Damages to homes were estimated to be $156,000. In the Greater Dallas-Fort Worth area, 40 cars were damaged at an estimated cost of $8,000. Damages to roads and bridges were estimated at $10,000. Minor flooding occurred on the East Fork of the Trinity River at Crandall, and a crest 3.5 feet over flood stage occurred on the Trinity River at Dallas. These were the only reporting stations to go over flood stage. Flooding on the extreme lower Trinity which had been in progress since April ended on the 10th. A secondary crest 2.5 feet over flood stage on the 2d resulted from rains of 2 inches or more late in June.	0	174
Guadalupe, Nueces and Rio Grande Rivers (Texas)	Flooding on the lower Guadalupe which began late in May continued until the 15th with a secondary crest 4.5 feet over flood stage on the 3d. This crest resulted from rains of up to 4 inches or more late	0	N.A.

WEST GULF OF MEXICO DRAINAGE-Cont'd

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	in June. These rains also caused flooding on the lower Nueces which began on the 1st, with crests about 4 feet over flood stage at Tilden and Mathis Bridge. The Rio Grande Basin received heavy rainfall during July with some totals of 8 to 10 inches. The storm of the 17th-18th deposited at least 3 to 4 inches above Eagle Pass. Reports are scarce in this area and none are received from the Mexican side. The Rio Grande crested 16 feet over flood stage at Eagle Pass but 4 feet below flood stage downstream at Laredo.		

GULF OF CALIFORNIA DRAINAGE

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
Colorado River Basin (Nevada)	Major flash flooding occurred in Las Vegas on the 3d caused by at least 3 inches of rainfall over the mountains west of the city. The flood wave moved down the wash by Caesar's Palace destroying or damaging about 700 vehicles. Heaviest damage was reported in North Las Vegas, estimated at $3.5 million. Two employees of that city were drowned while driving across a flooded area. On the 29th flash flooding was reported along the Virgin River near Mesquite and considerable highway damage occurred near Caliente. Highway 93 was washed out in three places, and four culverts were washed out along the highway south of the town.	2	6,000
Colorado River Basin (Arizona)	Flash flooding occurred in Havasupai Canyon and Supai Village on the 8th with damage estimated at $50,000. On the 14th rainfall unofficially reported as 3.5 inches in 45 minutes caused flash flooding along Soldier and Mormon Washes in Oak Creek Canyon with roads, houses, and trailers flooded. Damage estimated at $510,000. Urban flooding was reported in southeast Maricopa County on the 16th and in Tucson on the 16th and 24th. Flash flooding was also reported on Sacramento Wash in Mohave County on the 26th and in northern Yuma County on the 30th, where a detention dam and dikes were destroyed on Centennial Wash near Weldon.	0	600

COLUMBIA RIVER BASIN

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
Snake River Basin	July was considerably warmer than normal over the Basin and thunderstorms were more intense and widespread. Rainfall associated with these storms was also heavier than usual and a number of flash flood events were reported. Major damage occurred in some areas but that due to flooding was not always	0	N.A.

Clemson University Library

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	COLUMBIA RIVER BASIN-Cont'd		
	separable from that caused by wind, rain, and landslides.		
	Stream flooding occurred along the Wallowa River at Enterprise, OR, from the 4th to the 12th. This resulted from thunderstorm rainfall and late melting of a heavier than normal snowpack over the Wallowa Mountains. Two inches of rain in 90 minutes was reported near Joseph, OR, on the 5th, which caused additional problems along Prairie Creek, a tributary of the Wallowa. No stage reports are received from that area. Wallowa County was declared a disaster area with damages estimated at $2.5 million. Affected by the flooding were 55 residences, 1500 acres of farmland, commercial buildings and transportation facilities.		
	Several flash flood events were reported in the Malheur River Basin in Oregon on the 12th. In the Westfall area flash flooding occurred along Bully Creek and a tributary, Clover Creek, where two bridges were destroyed, a third badly damaged, and a farm family lost a number of outbuildings, a car, and pickup truck. Losses were estimated at $750, 000, which also included damage to irrigation ditches and loss of baled hay as well as crops. In the Brogan area a farm family was forced to evacuate along Willow Creek, and Highway 26 was closed due to a bridge weakening. About 10 homes were flooded along Baxter Creek in the Jordan Valley.		
	Flash Flooding was reported along the Salmon River below Salmon in Lemhi County, Idaho, on the 14th and along the Rapid River, a tributary of the Little Salmon River, in Adams and Idaho Counties on the 11th. The Rapid River Fish Hatchery was inundated with considerable damage.		
	Urban flooding was reported in Moscow, ID, on the 16th. Flash Flooding caused extensive damage at Ontario, OR, and vicinity on the 29th and the Malad City, ID, interchange under construction on Interstate Highway 15 was damaged extensively by water from Maple Canyon on the 30th.		
	ALASKA		
Tenana River Basin	A series of heavy thunderstorms occurred over the Basin during the period of the 20th-23d. Amounts in excess of one inch in 24 hours were recorded at Fairbanks and 3 inches in 6 hours occurred over the Little Chena River tributary causing the stream to rise sharply to crest at 18.4 feet. The only flooding reported was along the Chisana River at Northway. Downstream the Tenana River crested 0.4 foot below the flood stage of 12 feet.	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

JULY 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)

PUERTO RICO

In general the month of July continued the relatively dry spell which has brought moderate to severe drought conditions to some north and south coastal zones and mild drought to the north and south slopes. For the most part, the interior higher level areas had near normal moisture conditions, especially for crop growth although the long term meteorological drought indices still indicated a persevering dry spell of moderate intensity. By the end of the month soil moisture deficiencies were near zero in the interior divisions but ranged upward to nearly six inches along the coastal plains. An easterly wave brought some heavier convective shower activity around the middle of the month with amounts as high as three to five inches in the higher cordilleras and two to three inches along the coasts. This same activity appeared again around the 20th. No significant flooding was reported but some street flooding occurred in the heavier urbanized areas of San Juan in the north and Ponce in south as well as Mayaguez on the west end of the island.

NO DATA RECEIVED

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code [illegible] defined in the August 1962 WMO circular entitled PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA.

Units: Milli-atm-cms

Station	Day of month

REFERENCE NOTES

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATE: Dates in the table are for the 24 hours ending at time of observation. In some cases the actual occurrence is on the calendar date preceding that shown. (See individual Climatological Data for times of observations).

+	And also on an earlier date or dates.
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch of water equivalent to every 10 inches of snowfall.

CLIMATOLOGICAL DATA - METRIC UNITS: Data from airport unless otherwise specified.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile data can be evaluated.

B	Number of days maximum 21.1°C. or above for Alaskan Stations.
Y	Peak Gust.
+	And also on an earlier date or dates.
U	Indicates Urban site.
R	Indicates Rural site.
0	Station pressures apply to elevations shown in the "Elevations" table of the annual issue of this publication.

Conversion formulae to English Units are as follows:

1 foot = 0.3048 meters
°F. = $\frac{9}{5}$ x °C + 32
1 inch = 25.4 millimeters
1 mile per hour = 0.447 meters per second

HEATING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

COOLING DEGREE DAYS: Data from airport unless otherwise specified.

U	Indicates Urban site.
R	Indicates Rural site.

STORM SUMMARY:

°	Includes crop damage.
C	Crop damage.
*	No occurrence of storms or unusual weather phenomena reported.
@	Includes heavy sleet storm.
#	Freezing drizzle and freezing rain, commonly known as glaze.
0	For breakdown of "All Others," and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
‡	No Storm Data Report received for this State.
<>	Report Incomplete.
†	Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5 Million
7	$5 Million to $50 Million
8	$50 Million to $500 Million
9	$500 Million to $5 Billion.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS:

1/	Flooding continued at the end of the month.
NA	Not available.

FLOOD STAGE DATA:

#	Highest Stage Observed
1/	Continued at end of month
___	Highest Stage of Record
E	Estimated
P	Provisional (Flood Stage)
U	Unknown

RAWINSONDE DATA (Average Monthly Values):

All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. Number of observations refer to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures higher than -40°C. Observations of wind speed and direction are not made beyond the limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon. The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors. These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

*	Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.
+	Observations for these stations are scheduled at 0000 G.C.T.
†	Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES: Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

()	Clouds Present
*	Values corresponding to true solar noon
BD	Blowing Dust
BN	Blowing Sand
D	Dust
DI	Intense Dust
DM	Moderate Dust
DS	Slight Dust
F	Fog
GF	Ground Fog
H	Haze
HI	Intense Haze
HM	Moderate Haze
HS	Slight Haze
I	Intense Haze-indeterminable
K	Smoke
KI	Intense Smoke
KM	Moderate Smoke
KS	Slight Smoke
M	Moderate Haze-indeterminable
N	Sand
S	Slight Haze-indeterminable

NET RADIATION: The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA: These data are from an U-V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA: The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded $\Omega\ \Omega\ \Omega$) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made.

DESCRIPTION OF CHARTS

CHART I. A. NORMAL DAILY AVERAGE TEMPERATURE (°F. 1941-70) FOR MONTH. B. TEMPERATURE DEPARTURE FROM 30-YEAR MEAN (°F. 1941-70) FOR MONTH. Chart I-A is reproduced from monthly normals maps prepared at the National Climatic Center. Chart I-B is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin," a publication of Environmental Data Service.

CHART II. A. TOTAL PRECIPITATION. Chart II. A. is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin."

CHART II. B. PERCENTAGE OF NORMAL PRECIPITATION. Chart II. B. is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin."

CHART III. TRACKS OF CENTERS OF ANTICYCLONES AT SEA LEVEL.

CHART IV. TRACKS OF CENTERS OF CYCLONES AT SEA LEVEL. Centers which can be identified for 24 hours or more are tracked in these charts. Semi-permanent features such as the Great Basin and Pacific Highs and Colorado and Mexico Lows are not shown. The 7:00 a.m., e.s.t., positions are shown by open circles, with the intermediate positions at 6-hour intervals shown by X's. The date is given above the circle and the central pressure to whole millibars below. A dashed track indicates a regeneration rather than actual movement to the next position. Squares indicate position of stationary center for period shown beside it.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

AUGUST 1975

GENERAL SUMMARY OF WEATHER CONDITIONS

Dr. Richard E. Felch, Climatologist

HIGHLIGHTS: August rainfall across the Nation ranged from little or no precipitation at several western stations to 11.69 inches at Baton Rouge, Louisiana. Rainfall in most areas east of a line from eastern South Dakota to Louisiana was well above normal, except in the southern Atlantic Coast States. West Texas, the Pacific Northwest, and some stations in California also measured well above normal rainfall. Much of the long-awaited moisture in the North Atlantic States, particularly in Minnesota, Iowa, and Missouri, came too late to prevent serious moisture stress to row crops, which are ahead of last year and normal.

Temperatures generally averaged above normal from the Plains eastward and in the Southwest.

August began by bringing unwanted rain to the Deep South, much needed rain to some North Central States, and record heat and stagnant polluted air to the East. In the last few days of July and first few days of August over 10 inches of rain fell along the Gulf Coast. Temperatures over 100° were common throughout New England. Boston experienced its warmest night in over 100 years with an early morning low of 83° on the 2d.

During the week ending on the 10th, temperatures averaged below normal in the East, finally breaking the extreme heat. The Corn Belt was also cooler than normal. Only the Southwest, central Great Plains, and western Corn Belt reported above normal temperatures. However, little precipitation fell in most areas. The only significant rainfall spread from the Gulf States northeastward to New England ahead of the cold front that broke the heat wave.

The best rainfall in many weeks favored the Corn Belt during the 13th-17th, when over 2 inches fell in parts of Missouri, Iowa, and Illinois. Rains aided development of row crops, but moisture shortages continued to cause stress, particularly in the North Central States. Heavy rains also fell in parts of Oklahoma, Arkansas, and the Appalachians.

Above normal temperatures returned to the eastern half of the Nation, but readings were below normal in the West, except the Pacific Northwest.

Above normal temperatures, plus heavy rains in the northern Corn Belt States, continued to push crop development during the 19th-24th. Dry conditions, though, persisted in the central Great Plains. The Pacific Northwest received unusually heavy precipitation for this time of the year, when two frontal systems passed through the area, causing some harvesting problems.

Unseasonably cool temperatures along the Canadian border and in the western States contrasted the hot, humid conditions in the mid-Atlantic Coast States.

Cooler temperatures descended on the Nation's midsection, in the final week of August. Heavy rains accompanied the cooler air and relieved many dry areas but caused problems for a few wet areas. Heavy rains, cooler temperatures and sometimes damaging winds were associated with the two frontal systems.

HURRICANE CAROLINE

AUGUST 24 - SEPTEMBER 1, 1975

National Hurricane Center, NOAA
Miami, Florida

Caroline originated as a tropical disturbance which crossed the west coast of Africa on August 15. The disturbance then moved towards the west southwest at 15 kts or slightly faster along the Intertropical Convergence (ITC) Zone. On the 18th, the system turned toward the northwest, breaking away from the ITC zone and gradually slowed its forward speed. By the time it reached a point about 600 mi. northeast of Puerto Rico, on the 22d, the speed of movement was 10 to 12 kts.

A second marked change in direction occurred on the 22d and 23d when the disturbance began heading towards the southwest. By midday on the 24th, satellite pictures showed that a closed circulation had been established at the surface with maximum winds of 25 knots and a central pressure of 1011 mbs. At this time, the system was identified as Tropical Depression number 5 of the 1975 Atlantic hurricane season.

The depression proceeded through the extreme southeastern Bahamas and across the mountainous terrain of eastern Cuba, where it briefly lost tropical depression status.

By the 27th, a closed surface circulation was reestablished and the depression had passed south of western Cuba. It was now moving in a direction just north of west and early on the 28th had passed through the Yucatan channel and moved into the southwest Gulf of Mexico.

The depression was located about 150 miles northwest of Merida and moving west northwestward at about 8 kts by the afternoon of the 28th. Satellite-observed cloud motions indicated that an upper level anticyclone had become established over the depression which resulted in a more favorable situation for intensification. Caroline was named a tropical storm early on the 29th as surface winds reached 35 kts and the central pressure dropped to near 1000 mbs. This occurred with the storm a little less than 400 mi. east southeast of Brownsville. At this time, because of the slowing of Caroline's forward speed and because of some indications of the possibility of a more northerly course, public statements were issued to interests along the south Texas coast as well as for northeast Mexico. These statements advised persons planning Labor Day holiday weekends along the seashore to keep in touch with future releases.

However, the storm proceeded to move just north of west and slowed to about 5 kts while continuing to intensify, and was upgraded to a hurricane on the 29th. A hurricane watch was announced for the Brownsville area on the morning of the 30th, as well as warning the northeast coast of Mexico, that the path of Caroline would project a landfall midway between Tampico and Brownsville.

Landfall actually occurred on the morning of the 31st, about 100 mi. south of Brownsville on the Mexican coast. Caroline's central pressure dropped four millibars per hour for about a six-hour period just prior to landfall. Maximum surface winds measured by Air Force reconnaissance aircraft were 100 kts and minimum measured sea level pressure was 963 millibars, both of these measurements within several hours prior to landfall.

The maximum wind reported by a land station was 42 kts at Brownsville on the 30th at 1642 GMT. Some minor flooding occurred in southeast Texas from heavy rain. No official reports have been received from Mexico. An air tour of the Mexican coast, by Mr. Dreumont of the Brownsville Weather Office, from Brownsville to the point of landfall approximately 100 mi. south, indicates that some rather significant flooding occurred with several small communities destroyed, presumably from the storm surge effect.

HURRICANE DORIS

AUGUST 28 - SEPTEMBER 4, 1975

National Hurricane Center, NOAA
Miami, Florida

Hurricane Doris developed from a subtropical system in the mid-Atlantic.

On August 27, a front which had swept southeastward over the north Atlantic was becoming stationary from the Azores southwestward. Ship reports that day suggested development of a wave along the front around latitude 31N, longitude 46W, although surface pressures were no lower than 1016 mb., as satellite photographs showed broadening of the cloud band associated with the front in that area. The system deepened during the next two days while satellite photographs showed that the associated cloud mass was becoming circular and completely isolated from the original frontal band. Although the system was not designated a subtropical storm until the 29th, post-analysis suggests it reached that stage on the 28th.

At the outset, the storm's structure was typical of many subtropical cyclones investigated by Hebert and Poteat in the development of their subtropical classification system. There was no central dense overcast (CDO), and a band of strong convection existed well southeast of the surface center. However, the CDO began gradually to appear and by the 30th there was a well-defined CDO nearly three degrees of latitude in diameter. An eye was in evidence by the 31st, and the system was upgraded to a hurricane on the basis of satellite photograph evaluation. Further intensification ensued, the hurricane reaching its maximum strength on September 2 and 3 when its maximum winds were estimated at 95 kt with a minimum sea level pressure of 965 mb. By the 4th the storm had become absorbed in a prefrontal trough, losing tropical structure and strength as it moved on a north northeastward course north of latitude 40N.

Unfortunately there are few data available, apart from ship reports and satellite imagery, to monitor the transformation of Doris from any essentially cold-core system to a hurricane. However, on the 28th, when storm strength was attained, the surface circulation center was situated directly beneath the upper level low (200 mb). There was little change in their relative positions until the 31st when the 200 mb low became an open trough with the hurricane located slightly west of its axis. By September 1, the trough had disappeared and Doris was under weak upper anticyclonic flow until the 3d when it moved under cyclonically curved westerlies, after which it weakened rapidly.

The initial motion of the storm was toward the northwest. After two days it turned east southeastward in response to a prefrontal trough extending to lower latitudes. Finally, it accelerated north northeastward ahead of a deepening extratropical low off the Canadian Maritime provinces.

The hurricane was never a threat to any land area. It was monitored almost exclusively by ships and satellite, having been located beyond the authorized range of reconnaissance aircraft.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

AUGUST 1975

Herbert J. Thompson, Office of Hydrology

Record crest stages were reported during August on the White and Little Muskegon Rivers in Michigan, the Shoal River in Florida, and the Trempealeau River in Wisconsin.

Flash floods took a total of 7 lives during the month and did extensive damage in several communities including Cleveland, OH, Buffalo, NY, and Des Moines, IA.

The major flooding in northwestern Florida which began in late July continued into early August. Moderate flooding was reported on the Lumber River in North Carolina, the Pearl River in Mississippi, the Cache River in Arkansas, the upper Calcasieu River in Louisiana, and the lower Neches Basin and lower Trinity River in Texas. Minor flooding was reported in a few areas of the country.

These and other hydrologic events of unusual significance or involving loss of life or property damage are discussed in more detail below.

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	ST. LAWRENCE DRAINAGE		
Great Lakes Drainage in Michigan	Record monthly rainfall totals and record crest stages occurred in lower Michigan during August. Rainfall the first three weeks of August was near normal for most of Michigan with no flooding problems. Beginning on the 21st heavy rainfall occurred over the southern Lower Peninsula through the end of the month with new August total rainfall records being set at many locations. Among them are: Muskegon, 9.88; Lansing, 9.81; and Detroit, 7.83. Amounts up to 13 inches were recorded for the month by some cooperative observers. The period August 29 through September 1 produced very heavy rainfall, with totals of 3 to 6 inches being common for the period and more than 7 inches recorded in some west central locations. An amount of 6 inches in 24 hours was reported in the headwaters of the White Basin with a record crest stage at Whitehall on September 1. A record stage also occurred on the little Muskegon River at Morley. Extensive agricultural damage occurred with many communities affected by urban flooding. A large number of home basements were flooded throughout the area. Flooding continued into September on these streams. No flood stage has as yet been established for them.	0	N.A.
Cleveland, OH area	Severe urban and flash flooding struck the Cleveland, OH area during the period of the 24th-31st. The major damage was caused by the storm of the 24th, which deposited amounts of up to 5 inches over the greater Cleveland area during a period of about two hours. A storm of this intensity has been estimated by the Cleveland office to have a return period in excess of 100 years. The heaviest concentration of rain was over the lower Big Creek Drainage, inundating the Brookfield Recreational Park, the Cleveland Zoological Park, and an industrial park downstream where the major damage occurred. Although extensive damage occurred at the zoo there was surprisingly no loss of life there, either human or animal, in spite of the Sunday crowds. However, two people	2	5,000

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

AUGUST 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	MISSOURI BASIN		
James, Big Sioux and Floyd River Basin	The rural flooding which had continued along the Columbia to Stratford reach in South Dakota since May ended at Columbia on the 23d but continued into September at Stratford. Isolated heavy thunderstorms during August caused urban flooding in Sioux Falls, SD, on the 1st and 23d. Sharp rises occurred on the Big Sioux and Floyd Rivers during the month, but no flooding resulted.	0	N.A.
Little Sioux River	Slowly moving thunderstorms produced rainfalls of 5 to 6 inches over northwest Iowa on the 18th. Additional amounts of 3 to 4.5 inches fell on the 21st to 22d. The only flooding reported, however was on the Little Sioux River, which crested 0.5 foot over flood stage at Spencer on the 23d.	0	N.A.
Platte River Basin	Isolated thunderstorms caused local flooding in several places in the headwaters of the South Platte River with rather extensive agricultural damage over limited areas. No details are available. A thunderstorm on the 29th produced 3.5 inches of rain at Ashland, NE, in a short period. About 1,500 feet of U. S. Highway 6 was covered with up to 2.5 feet of water in the vicinity of Lanoma Beach.	0	N.A.
Republican River Basin	Flash flooding took two lives in northwestern Kansas on the 1st. Two small children drowned when the car in which they were riding was washed off a bridge over Sappa Creek 7 miles northeast of Oberlin, KS. Rains in excess of 3 inches over the Sappa Creek Basin caused the flooding.	2	N.A.
Missouri River Main Stem	The Missouri River continued over flood stage the entire month at Williston, ND, as the elevation of the pool behind Garrison Dam remained high. Excessive releases from Gavins Point Reservoir flooded 2,100 acres of lowland between Ponca and Omaha, NE, and 250 acres between Omaha and Rulo, NE, during August.	0	N.A.
	OHIO BASIN		
Monongahela River Basin	Two periods of heavy thunderstorm activity occurred during August. Rainfall of up to over 2 inches on the 13th followed by amounts of 3.5 to 4 inches on the 15th-16th caused significant small stream flooding over the headwaters of the basin. Lowland flooding was reported along the West Fork River from Clarksburg to Fremont, WV. No reporting stations went over flood stage. Amounts of 2.5 to 3.5 inches occurred on the 30th-31st, but no flooding was reported.	0	N.A.
Kanawha River Basin	Heavy rainfall on the 31st caused small stream	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

AUGUST 1975

Basins and Streams	FLOOD EVENT	Lives Lost	Preliminary Estimate of Property Damage (thousands of dollars)
	OHIO BASIN-Cont'd		
	flooding in Greenbriar County. Ronceverte, WV, reported an unofficial total of 6 inches during the afternoon. This storm was very localized and only a minor rise resulted on the Greenbriar River.		
Licking River Basin	Flash flooding took one life on the 10th. A three-year old boy drowned when the car in which he was riding was washed off the Morning Glory Road Bridge across Bobtown Creek in western Nicholas County, KY. The stream rose about 8 feet in 10 minutes in response to rainfall estimated at 4.5 inches in 30 minutes. The nearest rainfall station at Cynthiana, 5 miles west of the site, reported 2 inches for the period.	1	N.A.
Salt River Basin	Flash flooding was reported on Rock Run and Glens Creek in Washington County, Kentucky, on the 10th. No details are available.	0	N.A.
	WHITE BASIN		
Cache River	Rainfall was much above normal over the basin during August and fell mostly during three periods - the 1st-4th, 17th-19th, and 27th-31st. The Cache River was at or over flood stage the entire month except for two brief periods and flooding continued into September. Damage was agricultural with some soybean crops lost.	0	N.A.
	LOWER MISSISSIPPI BASIN		
Mississippi River Main Stem	Urban and flash flooding struck portions of Mississippi bordering the River on the 1st as a result of 24-hour rainfall amounts of up to 6 inches. Urban flooding in and around Vicksburg necessitated some evacuations, and U. S. Highway 61 north of Vicksburg was closed for a time by 4 to 6 feet of water. Flash flooding damaged the State Route 33 Bridge over the Homachito River.	0	N.A.
	WEST GULF OF MEXICO DRAINAGE		
Mermentau and Calcasieu Rivers	Monthly rainfall totals ranged from 5 to 12 inches over these river basins. Most of this rain occurred during the first week of the month and resulted in flooding on the Mermentau and Upper Calcasieu Rivers. About 3 feet of flooding occurred on the Calcasieu at Hineston, LA, and one foot at Mermentau, LA, on the Mermentau River.	0	N.A.
Neches and Trinity River Basins	Rainfall of 2 to 5 inches the first ten days of the month, with heavier amounts generally along the coast, caused 2 to 3 feet of flooding on the Village Creek and Pine Island Bayou tributaries of the Neches River. A crest occurred on the Trinity River at Moss Bluff, TX, of 1.5 feet	0	N.A.

GENERAL SUMMARY OF NATIONAL FLOOD EVENTS

	WEST GULF OF MEXICO DRAINAGE-Cont'd		
	over flood stage. Lowland flooding was reported on the Neches River at Evadale, TX, and on the Trinity River at Liberty, TX, but flood stage was not exceeded at those points.		
Rio Grande Basin	Several instances of urban and/or flash flooding occurred in the New Mexico portion of the basin during August. The most extensive damage occurred in Corrales (Sandoval) on the 13th when an official rainfall amount of 2 inches caused flooding which was compounded by a break in the irrigation ditch. It was reportedly the worst flooding there since 1929. Urban flooding was reported in Las Cruces on the 3d, in portions of Albuquerque on the 8th, 12th, and 21st, and in Gallup, Chimayo, and Sante Fe County on the 12th. Flash flooding was reported in Cuarleles on the 16th. No river flooding resulted from these localized storms.	0	N.A.
	PUERTO RICO		
	August was marked by the passage of several easterly waves across Puerto Rico, which brought on moderate to heavy showers and thundershowers over much of the western and southern sections of the island. No flooding occurred during the month although saturated soil conditions in the western region brought on rapid surface runoff and some ponding in low lying areas. Soil moisture deficiencies in the southern and northern divisions continued to average around five to six inches. Moderate agricultural drought conditions predominated in the southern division while most other zones were near normal. Meteorological drought was severe in parts of the interior and the north coast and moderate in most other zones. In general the month of August had near normal rainfall in all but the southern zones where more rain is needed for agricultural work.	0	0
